istorii geologii)

PERIODICAL: V sb.: Vopr. istorii yestestvozn. i tekhn. Nr 1, Moscow,
AN SSSR, 1956, pp 312-314

ABSTRACT: In his report, "The State of Knowledge of and the
Problems in the Scientific Research on the History of
Geology", D. I. Gordeyev points out the main courses
leading to the development of the history of geology.
These courses are: clarifying the history of geology
from the Marx-Lenin viewpoint; establishing the part
played by the Russian geologists in the development of
geology; a systematic study of the old documents on the
history of geology. This work should include the
development of a method for subdividing the history of
geology into periods, writing of monographs on the main

Card 1/3

15-57-2-1197

Convention on the History of Geology (Cont.)

stages in the growth of various branches of geology, and writing of monographs on the history of separate important problems and discoveries. Scientific research on the history of geology should explain the ideological struggle in the science of geology, and it should show how the elements of the objective dialectic of nature were discovered in the course of growth of geology. It will be necessary in this work to clear the history of geology of all falsehood. The development of geology in Russia should be studied together with the development of this science in the whole world. N. S. Shatskiy pointed out the necessity for studying the archives of not only the Department of Mines, but also those of the universities and other scientific organizations where the greatest geological workers of Russia were concentrated. V. V. Tikhomirov proposed that the plan for publishing works on the history of geology be broadened, and also that the "Syllabus of Russian Geologists" be prepared. The convention resolved that the efforts of the scientists working on the subject of the history of geology

Card 2/3

Convention on the History of Geology (Cont.)

should be concentrated on the creation of a popular scientific
work, "The History of Geology."

SUBJECT: USSR/Obituaries

AUTHOR: Tikhomirov, V.V. and Volkova, S.P.

TITLE: Losses of Science (Poteri nauki)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1957,
6, p 107-108 (USSR)

ABSTRACT: The authors give brief obituaries on the Soviet geologists
who died during the period from May 1956 to February 1957:
Professor Semikhatov, A.N., a Lenin-Award winner, died on 29
May 56;
Kurochkin, V.I., Chief Geologist of the Georgian Geologic
Administration, died on 16 Aug 56;
Romanov, B.M., Candidate of Geological-Mineralogical Sciences,
died on 11 Nov 56;
Professor Mikheyev, V.I. died on 12 Dec 56;
Speranskiy, B.F., Doctor of Geological-Mineralogical Sciences,
died on 30 Dec 56;
Grigor'yev, P.K., Candidate of Geological-Mineralogical
Sciences, died on 31 Dec 56;

TITLE: Review and Discussion of "A Concise Outline of Geological
History" by V.V. Tikhomirov and V.Ye. Khain (Kritika i
Diskussii: o "Kratkom ocherke Istorii Geologii"
V.V. Tikhomirova i V.Ye. Khaina)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya,
1957, #6, p 110-116 (USSR)

ABSTRACT: V.A. Obruchev briefly reviews the contents of the book
under consideration and gives it an entirely positive
evaluation. However, Mr. V.I. Popov reviews the book in
more detail and, admitting its value and positive qual-
ties, notes some negative features and drawbacks. In
general, Popov holds this book as a success, especially
in the description of the initial and subsequent stages
of the history of geology, but not of the latest stage.

TITLE: Establishing the possibility of using alpine acclimatization for the preparation and training of cosmonauts [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24-27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 300-302

TOPIC TAGS: hypoxia, high altitude physiology, alpine acclimatization, cosmonaut training

ABSTRACT:

Tasks of the present study were to:

1. Conduct complex physiological and clinical investigations during the process of acclimatization at altitudes of 3300 to 4100 m.

Card 1/4

ACC NR: AT6036616

2. Study the influence of alpine acclimatization on human tolerance to extremal spaceflight factors.

3. Study the comparative resistance of alpine inhabitants, valley inhabitants, and alpinists to extremal factors.

4. Develop a system of alpine acclimatization for cosmonauts and issue recommendations on the application of alpine acclimatization for the preparation and training of cosmonauts and on the creation of alpine camps for cosmonauts.

Acclimatization was conducted at the alpine station of the Kirgiz State Medical Institute (Tuya-Ashu mountain pass, altitude, 3300 to 4100 m). A total of 28 male subjects were studied of whom: 11 were indigenous to alpine conditions as farmers of the Tien-Shan--Pamir region (2000 to 2500 m), 11 were valley inhabitants, and 6 were accomplished alpinists. The following indices were studied under alpine conditions and using test stands: Functional condition of the central nervous system; external respiratory and cardiovascular system function; some biochemical indices; the state of the blood coagulation and anticoagulation capacity; and in separate experiments; cerebral circulation using an electroplethysmographic method.

Card 2/4

ACC NR: AT6036616

The experiments showed that after 45 days of alpine acclimatization, human tolerance to prolonged, back-chest accelerations (8 to 10 G) was improved. This was reflected in a relative increase in the amplitude of rheoencephalograms for all subjects and consequently, improved cerebral circulation and lowered pulse rate. EKG changes indicated that the heart was undergoing less strain after alpine acclimatization. After residence in alpine conditions, a decrease in basic metabolic indices and a slight increase in arterial blood oxygen saturation was noted in alpine inhabitants during accelerations.

A study of heat tolerance showed that there was a drop in basic physiological parameters (heat accumulation and basal metabolism) after alpine acclimatization in all three groups. These changes were more pronounced in indigenous alpine inhabitants and less pronounced in alpinists.

The resistance of the organism to hypoxia before and after acclimatization was studied using two approaches; exposure to a certain "altitude ceiling" in a pressure chamber and a method of reverse respiration using a spirograph first filled with atmospheric air. In the latter case as a measure of oxygen consumption, oxygen content under the bell jar of the spirograph decreased and exhaled carbon dioxide was chemically absorbed.

TOPIC TAGS: biologic acceleration effect, animal physiology, dog,
hypoxia, space physiology, human physiology

ABSTRACT:

The author reviewed the literature as well as experiments on humans (1500 tests using 120 subjects) and white rats (375 tests). He stated that changes in oxygen balance in humans are one of the main factors limiting prolonged G tolerance. This is primarily due to circulatory and respiratory functions which are directly affected by accelerations. The magnitude of these changes depends on the magnitude and duration of accelerations.

Card 1/4

ACC NR: AT7011650

Changes in external respiration including gas exchange during accelerations can be attributed to biomechanical difficulties and disrupted pulmonary circulation. Here, increased work by diaphragm muscles increases oxygen consumption. At high acceleration magnitudes (12 G and higher), this disruption of gas exchange renders the entire external respiratory process "unprofitable," or inefficient.

Up to 8-12 G, there is an increase in the activity of pulmonary ventilation reflected in accelerated respiration and an increase in per-minute volume. A further increase in acceleration magnitude leads first to relative and then to an absolute decrease in volumetric indices of external respiration. With an increase in acceleration, there is a steady 200 ml/G decrease. An increase in the per-minute respiratory volume in the 8-12 G range is associated with increased O₂ consumption and elevated CO₂ elimination. However, the relative efficiency of pulmonary ventilation decreases as acceleration magnitude increases. The percentage content of O₂ in respired air increases while CO₂ decreases. An analysis of the literature and data from the author's experiments indicate that the nature of qualitative changes in the gaseous composition of respired air is associated with an

Card 2/4

ACC NR: AT7011650

increase in physiologically dead space due to changes in pulmonary circulation. Accelerations cause arterial hypoxemia, the severity of which depends on acceleration magnitude and duration. Beyond a dependence on acceleration magnitude, the level of hemoglobin decreases by 60-65%. The general oxygen requirement under these situations also does not depend on acceleration magnitude and is a constant value.

The circulatory system plays a leading role in supplying oxygen to the brain during acceleration. In experiments on human subjects, cerebral circulation and circulation in external vessels of the head were monitored. The force vector of acceleration plays an important part here, especially the longitudinal component. When the value of this component reaches 1.6-1.3 G, there is an increase in the pulsed pooling of cerebral vessels. At 3 G, a normal situation prevails while at 5 G, blood pooling decreases by a factor of two. EEG data was used as an index of the state of cerebral circulation.

In experiments with animals, general oxygen consumption, oxygen tension in tissues, and the tissue

Card 3/4

ACC NR: AT7011650

oxidation reduction potential were studied. Here, it was established that during accelerations, there is a displacement of oxygen balance in various tissues with a tendency toward insufficient oxidation which depends on acceleration magnitude and duration as well as specific metabolic qualities of the tissues under study. For instance, the period necessary for the elimination of oxygen depth in the brain was 1.5-2.0 times shorter than for skeletal muscles.

In experiments where animals and humans were exposed to various atmospheric conditions during acceleration (normal, increased oxygen partial pressure, and decreased barometric pressure to 405 mm Hg), it was found that increased oxygen pressure improved resistance to prolonged accelerations. However, when general and cerebral hemodynamics were disrupted due to a high longitudinal acceleration component, this positive effect was eliminated by a disruption of gas exchange. Increased oxygen partial pressure (100 mm H₂O) increased human tolerance of 12 G by 35-40 sec. [ATD PRESS: 5098-P]

Upper tropospheric propagation of ultrashort radio waves (Dal'neye troposfernoye repropstraneniye ul'trakorotkikh radiovoln) Moscow, Izd-vo "Sovetskoye radio", 1965. 414 p. illus., biblio. 4000 copies printed.

TOPIC TAGS: radio wave propagation, tropospheric radio wave, radio communication, space communication, tropospheric scatter communication, signal processing, signal distortion, field theory

PURPOSE AND COVERAGE: This monograph is intended for specialists working in the field of radiowave propagation, designers of long-distance radio communication systems, and teachers and students of the advanced courses in schools of higher technical education. The monograph contains, for the most part, heretofore unpublished results of Soviet experimental and theoretical investigations in the field of long-distance tropospheric ultrashortwave propagation.

Card 1/10

WAC: 621.3N.24

ACC NR. AM5027749

Problems of investigating the troposphere by means of refractometers, the mean level of signals, meteorological conditions and topography, fluctuation of arrival angles and distortions of antenna-directivity patterns, losses in antenna gain, and quick and slow fading of signal levels are discussed. The statistical characteristics of the signals at diversity reception in time, space, frequency and angle as well as the distortion of signals in the communication systems are also investigated. The long-distance propagation theory is analyzed, and the engineering method of calculating field intensity at long-distance tropospheric propagation is given. At present, there is no theory of Long-Distance Tropospheric Propagation which can be applied effectively enough in practice. Thus, in the investigation of that propagation, considerable attention has to be paid to experiments. The special characteristics of geographical conditions of the territory involved should be taken into consideration during the analysis of experimental data and in their practical application because the conditions of propagation in arctic and tropical climates differ from those existing over seas and continents. A considerable part of the monograph deals with the investigation of long-distance tropospheric propagation carried out over dry land routes, 800 km long, in the central part of the USSR under the general supervision of B. A. Vvedenskiy and A. G. Arenberg (up to 1957). V. I. Siforov investigated problems con-

TITLE: The Importance of Moisture Content of Coal Charges for
the Carburisation Process

PERIODICAL: Koks i khimiya, 1959, Nr 10, pp 19-24 (USSR)

ABSTRACT: The influence of the moisture content of coal on the technological indices of coke oven operation and the quality of coke produced was investigated. The investigation was carried out on an underjet coke oven battery of 7 ovens with mean oven width of 407 mm and a height of 4300 mm. Two coking periods 14 and 15 hours were tested. During the experiments, the composition of the coal blend, its degree of crushing, and the coefficient of the excess air were kept constant. The quality of the coal blends and coking conditions - table 1. The dependence of the bulk density of the blend on its moisture content - fig 1, the dependence of the consumption of heat for coking on the moisture content of coal - fig 2 (curve 2); the dependence of temperature conditions in the tar

Card 1/2

Sov/68-59-10-5/24

The Importance of Moisture Content of Coal Charges for the Carburisation Process

line plane of the coke on the moisture content of coal - tables 2 and 3; the distribution of temperatures along the width of the charge during coking - fig 3; the dependence of the coke quality on the moisture content of coal - table 4. It was found that changes in the moisture content mainly affect the technological indices of coke oven operation. An increase in the moisture content of coal up to 10-11% noticeably affects the size distribution of coke (an increase in small sizes), but has little influence on the coke strength. There are 3 figures, 4 tables and 3 references, 1 of which is English and 2 German.

TITLE: The consumption of heat for coking coal tar pitch.
(Raskhod tepla na koksovanie kammenougol'nogo peka)

PERIODICAL: "Koks i Khimiya" (Coke and Chemistry),
1957, No. 4, pp. 27 - 31, (U.S.S.R.)

ABSTRACT: A description of the apparatus based on the principle of adiabatic calorimeter for the determination of heat consumption in various temperature ranges during coking of pitch is given (Fig. 1). Using this apparatus the heat consumption during coking of medium and high temperature pitch and a gas coal was determined within various temperature ranges up to 600°C. The results obtained are shown in graph form. The difference in the heat consumption during the coking of medium and high temperature pitch appears in the temperature region 450-500° when it amounts to about 38%. There is 1 table, 5 graphs and 5 references, including 4 Russian.

Tikhomirov, Yu., Yu. L.

AUTHOR: Tikhomirov, Yu. L.

TITLE: Some Problems in the Technology of Coking Coal Tar Pitch
(Nekotoryye voprosy tekhnologii koksovaniya kamennougol'nogo peka)

PERIODICAL: Koks i Khimiya, 1957, Nr 10, pp.25-30 (USSR)

ABSTRACT: Experimental investigations of the influence of properties of the starting material and method of its heating on the quality of pitch coke were carried out. Temperature phenomena in the lining and in the charge of industrial ovens were also studied. Changes of properties of non-volatile residues at various carbonisation stages were studied on the basis of changes in the strength of the material, yield of volatile substances, hardness, true specific gravity, specific electrical resistance and "degree of lattice order" from the X-ray data. Coking experiments were carried out in a special steel retort, heated in an electric shaft furnace. Two heating practices were used (Table 1). On reaching the temperature required (450, 550, 700 and 900°C) the retort was quenched in water. Regarding the influence of the quality of the carbonised material on the properties of coke produced under the same heating conditions it was found that high temperature pitch produces coke with better mechanical properties (Table 4).

Card 1/3

68-10-7/22

Some Problems in the Technology of Coking Coal Tar Pitch.

The strength of coke increases with decreasing heating rate. It is pointed out that as the technology of manufacturing electrodes requires an ignition of all carbonaceous materials to a temperature of 1300-1500° C it would be correct, on the basis of data obtained in this work, to produce pitch coke at a temperature in the axis plane of the oven of 700-750°C, i.e., the temperature above which the rate of increase in the strength of coke is comparatively small. Measurements of temperature of the surface of the oven lining under conditions of intermittent and continuous charging of ovens were carried out. The results obtained are shown in Figs.1 to 4. With intermittent charging sharp variations in the temperature of refractories (up to 600°C) take place on addition of each portion of pitch. With continuous charging there is only one fall in the wall temperature lasting about one hour, followed by a slow rise after the charging is finished. By slowing down the rate of charging (4 hours) the minimum wall temperature can be maintained at about 700°C. Measurements of the temperature in plane of oven axis indicated that for pitch (with a softening temperature 120-140°C) the formation of coke

Card 2/3

68-10-7/22

Some Problems in the Technology of Coking Coal Tar Pitch.

of a stable structure under industrial conditions takes place at temperatures of 460-530°C. A temperature of 700 to 750°C in the tar line plane is reached in 10 to 13 hours. This indicates a possible increase in the output of about 30%. Measurements of the level of the coked material indicate that in individual periods the level of the charge is 2.5 times higher than calculated. It was found that by decreasing the rate of charging from 50-80 kg/min to 35-40 kg/min, the coefficient of utilisation of the working volume and operating conditions of the oven refractories can be considerably improved. Analyses of gas during various coking periods (Figs. 5 and 6) indicate that the method of charging has little influence. It is concluded that the present method of coking pitch scarcely corresponds to the specific properties of the material and requires revision of the heating method. For this purpose a new type of oven with a direct method of heating (gaseous heat carriers or high frequency currents) should be developed. There are 4 tables, 6 figures and 4 references, all Slavic.

Effect of a diet with deficient content of nicotinic acid, tryptophan,
and protein on nicotinic acid metabolism in dogs. Voprosy Pitaniya 12,
No.1, 50-9 '53. (CA 47 no.14:7050 '53) (MLRA 6:3)

1. Nutrition Inst., Acad. Med. Sci. U.S.S.R., Moscow.

TKHOMIROVA, B. N.

U.S.S.R.

"Nicotinic acid metabolism during aviantry." A. V. Konakovskaya and A. N. Tikhomirova (Inst. Nutrition Acad. Med. Sci. U.S.S.R., Moscow). "Voprosy Pitaniya" 13, No. 1, 15-21 (1954). Twenty-six patients suffering from an acute and 21 patients suffering from a chronic form of dysentery received a normal diet which was supplemented after 2-4 days of treatment with 400 g. cottage cheese and some tryptophan. Metabolism of nicotinic acid in the organism of the patients was studied by the levels of urinary *N*-methylnicotinamide (I) and of dihydronicotinamide ribonucleoside (II) excreted in the blood. The daily excretions before treatment were 17.8 ± 1.6 (range) and 7.68 ± 1.64 (chloral), the blood II contents 13.2 ± 0.44 and 18.7 ± 1.07 $\mu\text{g}/\text{dl}$, the total amt. of plasma proteins (III) 7.25 ± 0.10 and 7.23 ± 0.24 , plg. in albumin (IV) 5.01 ± 0.16 and 4.00 ± 0.19 , plasma globulins (V) 2.07 ± 0.11 and 2.38 ± 0.10 , and fibrinogen (VI) 0.34 ± 0.39 and 0.20 ± 0.027 , respectively. During treatment the amounts of I excreted decreased, while the blood contents of II and III increased, while those of IV, V, and VI remained nearly unchanged. In the cases of the patients receiving the cottage cheese supplement the daily urinary decrease of I and the increase of II in blood were more pronounced, and an increase of IV at the expense of V was noticed. It is concluded that in the presence of a large amt. of dietary protein the I present in the organisms of patients suffering from aviantry is used for the biosynthesis of II. E. Weisbrot

Preparation of tryptophan-free casein hydrolyzate for use in the creation of niacinavitaminas in animals. A. N. Tikhomirova (Inst. Nutrition Acad. Med. Sci. U.S.S.R., Moscow). "Voprosy Pitaniya" 18, No. 2, 47-56 (1954).—To a 1/1. liter 1-Molar Ba(OH)₂ add 4250 ml. distd. water and 250 ml. concd. H₂SO₄, heat the mixt. to boiling, then add 800 g. powd. casein (previously washed clear of vitamins), and continue the boiling under reflux condenser for 25-30 hrs. To test, the total destruction of tryptophan take 0.5-1 ml. of the hydrolyzate and make the color tests with β -dimethylaminobenzaldehyde and HCHO. When the tests are neg., transfer the hydrolyzate to a 10-l. dish and neutralize at 60° with powd. Ba(OH)₂ until the Congo red indicator turns violet. Dil. the thick paste formed with distd. water 1:1, sep. the BaSO₄ by centrifugation, filter the supernatant through filter paper, and bring the filtrate to pH 4-5 by addn. of Ba(OH)₂. The hydrolyzate must be free from traces of Ba(OH)₂. Therefore, test a sample of the hydrolyzate for the presence of Ba(OH)₂ by the addn. of several drops of dil. H₂SO₄ and in case turbidity occurs add H₂SO₄ (dil. 1:3) to the hydrolyzate, remove the ppt. by repeated centrifugation, and test the supernatant for free H₂SO₄. Neutralize with dil. Ca(OH)₂ until the bromothymol blue indicator turns green (pH 7); traces of CaSO₄, if remaining in the hydrolyzate, do not affect the usefulness of the prepn. Filter the neutralized hydrolyzate once more, condense the filtrate on a water bath to 1.3 l., and transfer the product into a 100-150-ml. flask and sterilize for 30 min. in a Koch app. When kept in the cold, the hydrolyzate is stable for several months. B. Wierick.

Effect of niacin avitaminosis on conditioned reflexes in dogs. V. V. Efremov, A. I. Makarychev, and A. N. Tikhomirova (Inst. Nutrition, Acad. Med. Sci., U.S.S.R., Moscow). *Voprosy Pitaniya* 13, No. 3, 10-13 (1951).—In dogs fed a niacin (I)- and tryptophan (II)-deficient diet (a corn diet contg. some II-free casein hydrolyzates) the amt. of *N*-methylnicotinamide (III) excreted with the urine decreased from 0-12 (control) to 1.2-0.2 mg./day. During the restoring therapy (addn. of I to the diet) the amt. of the III excreted increased rapidly. The amts. of dipyridine nucleotides (IV) and proteins in blood did not change significantly (0-14 γ and 7.5-6.8 g./100 ml. blood, resp.) during the expt. The normal wt. was restored and the amt. of IV in blood was increased (up to 20 γ/100 ml. blood) after the exptl. dogs have received a 50-mg. dose of I. The avitaminosis was developed within 50-60 days of the feeding. During the avitaminosis the conditional reflexes were rapidly distorted; the disturbance of the higher nervous system (cerebral cortex) occurs much sooner than the appearance of the clinical symptoms of the avitamins.
B. Werbicki

the development of B₁-avitaminoses in White Rats.

Orig Pub: Vopr. pitaniya, 1956, 15, No 5, 75.

Abstract: The longevity of rats deprived of vitamin B₁ and
kept at a 34° [C] temperature was 2-3 times longer
than of rats kept at a 7-12° [C] temperature. The
weight loss was also greater in animals of the first
group than in those of the second group. A clearly
defined dependence of the time of death on the quantity
of pyruvic acid was observed in the second group
of the animals. In the first group such a relation-

relations" of LP in response to both weak (30 db) and strong (60 db) audial signals. After a prolonged period of internal administration of large doses of thiamine (5 - 25 mg/kg daily) 3 animals showed distinct improvement in "forced correlations" while one animal showed a slight deterioration. However, not one animal showed a stable or a paradoxical phase and the differentiation remained absolute. The problem evoked by the diametrically opposed results obtained by Zeval' [?] in earlier experiments by giving his dogs considerably lower doses of thiamine is considered. -- V. Gavlichek.

Influence of long-term introduction of vitamins into the ration on white rats, general condition and longevity. V. V. YEFREMOV, A. N. TIKHOMIROVA, E. M. MASLENKOVA, H. A. KAMJKO, O. I. PENAR and L. G. Gvozdova. Institute of Nutrition, A.M.S., Moscow, U.S.S.R.

In our observations, made on 400 white rats for about four years, we studied the influence of a complex of thirteen vitamins added to the ration of the animals since their weaning from females to their death. The rats were divided into groups which received additionally (a) vitamin complex (VC), (b) vitamin complex without vitamin E, (c) only vitamin B₁, (d) only vitamin B₂. We studied the influence of these additions on (1) the weight of body and its length. Animals receiving VC increased them faster. (2) The consumption of feed per 100 g. of body-weight by the rats receiving VC was, on the contrary, less. (3) Excretion of eight vitamins with urine and their content in organs. In urine the rats of the VC group of all ages had these indices higher than control animals. (4) Working capacity; the VC rats gnawed several times as much wood a day as animals of other groups. (5) Fertility and weight of litter; the number of litters from VC females, number of young rats in them, and their weight were greater than those from control rats. (6) The content of cholesterol in blood at the age of 1 year increased in all groups, but most of all in control group of rats. (7) The VC animals had a much lower morbidity and death-rates than control rats; the VC rats had the greatest duration of life of individual animals, that of animals which received B₁ and B₂ vitamins only was less, and rats of control group had the least longevity.
