3146. TIKHONOFF P. T., MOGILEVSKAYA O. YU. and DEMIDOVA V. M. \*A new leadless typographic alloy GIGIENA 1957, 1 (35-38) (Russian text) The article contains results of investigations carried out during the experimental use in the printing house of newspaper 'Izvestia' of a typographic alloy, containing 94% of zinc, 4% of aluminium and 2% of magnesium. For the use of this alloy the polygraphic machinery works have reconstructed the type-setting machine and made a new linotype. Exclusion of lead from the typographic alloy is a great achievement in the improvement of working conditions in the polygraphic industry. The content of zinc oxide in the air of the type-metal melting shop in the vicinity of the boiler did not exceed 0.2 mg./cu.m.; above the place of pouring out of metal pigs and in the centre of the workshop, for the most part, no zinc oxide was detected; over the containers with linotype the concentration of zinc oxide did not exceed 0.12 mg./cu.m. The discharge of metal zinc dust into the air of the working places of linotypists did not exceed 2 mg./cu.m. All this shows that with adequate ventilation and maintaining of the temperature regime for the heating of the alloy, there is no reason to fear that the concentration of compounds of zinc should reach the level which is liable to produce foundry fever.

AUTHOR: Yasyukevich, S.M. and Tikhonov, S.A. 136-6-4/26

TITLE: Method of Measuring Potentials on Minerals. (O metodike izmereniya potentsialov na mineralakh)

PERIODICAL: *Tsvetnyye Metally*, 1957, No.6, pp. 21-24 (USSR)

ABSTRACT: Measurements of potentials in the surface of minerals are often used in studying the action of reagents used in flotation processes. The present authors found difficulties in using the methods described in Soviet literature for such measurements. This article gives a description of their own recording method and some tables and graphs of some of the results obtained. Rods cut from natural sulphides served as electrodes, the rods being contained in open-ended glass tubes: one end of the rod was freshly-ground in the test solution, the other being connected in the circuit. Graphs are shown of potential against time for galena and chalcopyrite for pH values of 6.8-11, some curves for solution to which xanthate was added being included. Graphs are also given of potential against pH and of potential drop against pH for constant additions of xanthate and against xanthate concentration for constant pH. The results show that when bases are used as depressors for sulphide minerals flotation is hindered by the formation of hydrophilic surface films of Card1/2 metal hydroxides on the particles; but when butyl potassium

Method of Measuring Potentials on Minerals.

136-6-4/26

xanthate is added a favourable, hydrophobic film of metal xanthate is formed. When xanthate and base are added simultaneously the reaction of the former with the mineral surface decreases as the pH rises.

Title : Industrial Crossing of Latvian White and Estonian  
Lop-Eared Pigs

Orig Pub : Kolkhoznik. Sov. Latvii, 1957, No 12, 24-26

Abstract : As Latvian white sows were crossed with Estonian lop-eared boars, their fertility at birth was 12 percent higher on the average and the average weight of a litter was 25.8 percent higher at weaning than in purebred raising. At the age of 2 months, the average weight of a hybrid piglet was larger than the average weight of a purebred piglet by 8.8 percent. At the age of 2 $\frac{1}{2}$  - 3 months, nursing piglets were subjected to comparative fattening. As they were permitted to feed

Q

Abs Jour : Ref Zhur - Biologiya, No 5, 1959, No. 21255

freely, hybrid nursing piglets weighed 13 percent more at the age of 6 months than purebred piglets. During 108 days of fattening each piglet exhibited 11 kg more of live weight gain; the slaughtered weight of the hybrids is by 17 percent larger and their inner organs are much larger; the average length of the bacon halves is by 9.3 percent longer in hybrids at the age of 6 - 6½ months than in purebreds. A more uniform subcutaneous distribution of fat deposits in hybrids permits to use them for the production of high-grade bacon. -- D. Kh. Khachatur'yan

TOPIC TAGS: analog digital converter, voltage digital converter

ABSTRACT: A voltage-to-digital converter is described which consists of these units: a voltage commutator, a summation amplifier, three level-quantizers, twelve rectifiers, three 4-digit registers, two code-to-voltage converters, a voltage-sign shaper, and a main-and-offset-pulse generator. The overall static error of the converter is 0.3%. Circuit diagrams of the principal units designed with electron tubes and semiconductor devices are explained. The code-to-voltage converter uses a method of current summation in a matrix that comprises two resistor types. Six figures. Bibliography of 3 titles. N. P. [Translation of abstract]

AUTHORS: Tikhonov, V. A., Shpynova, L. G.TITLE: Strength gain accelerators instead of hydrothermal treatment  
for concretePERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1961, 355, abstract  
23K381 (Dokl. L'vovsk. politekhn. in-ta., v. 2, no. 2, '75, p.  
128 - 132)

TEXT: The article presents the results of the investigation of additions of  $\text{CaCl}_2$  and SSB (SSB) to concretes setting in various different circumstances (stored in water, in moist filings, steam blow, and steamed at pressures of 2 and 7 gauge atm.) 2%  $\text{CaCl}_2$  and 0.25% SSB per weight of cement were added respectively. Combined additions of 2%  $\text{CaCl}_2$  and 0.25% SSB were also tested. The tests were carried out with sand mortars 1:3 and 1:1:3 concretes. White cement and Portland cement of various screening grades from the Nikolayev Plant were used as the binding agents. The combined addition of  $\text{CaCl}_2$  and SSB was found to promote a

greater gain in strength than when used separately. The combination of these two additives and hydrothermal treatment was found to be particularly effective. The effect of the combined addition is roughly the same for all kinds and screening grades of cement. [ Abstracter's note: Complete translation. ]

Cements, Liner and Paste

**Effect of plasticizing and air-entraining admixtures on heat liberation and other characteristics of cement** (Continued from page 12)

The effect of plasticizing admixtures on the heat of hydration of Portland cement during the first 24 hr. after mixing when added in amounts of 1% or more by weight of the cement. Similar action took place with 2% of calcium and ammonium lignosulfonates and sulfite anhydrous calcium water. The effect of acetic resin on heat liberation is insignificant.  $\text{CaCl}_2$  with and without acetic resin sharply accelerated the heat liberation of hardening Portland cement during the first 20 to 30 hr. after mixing.

Effect of air-retaining additions on the water permeability and freeze resistance of cement mixtures. V. A. Tikhonov.  
Nauch. Zapiski Politekhn. Inst. No 10, Ser. Inzh.-  
Strukt. 1954, No. 2, 121-7; Referat. Zurn. Khim. 1955,  
Abstr. No. 55408; cf. C.A. 48, 6091e. — The effect of abietic  
resin, 0.05% of the cement wt., xylene 0.03%, xylene and Al  
(0.05% xylene + 0.10% Al), Al 0.10% and H<sub>2</sub>O<sub>2</sub> 1.80% is  
investigated. The highest water permeability is caused by  
H<sub>2</sub>O<sub>2</sub>, and the lowest by the addn. of xylene-Al mixt. The  
best freeze resistance is obtained by adding abietic resin  
(20% strength loss after 95 cycles of alternate freezing and  
thawing), next addn. of xylene (50% strength decrease), and  
the lowest resistance the addn. of H<sub>2</sub>O<sub>2</sub> (58% decrease). It  
is noted that the more hydrophobic the addns., the more  
pronounced their effect. N. Vasilev //

For particles of cement and clay the zeta potential is negative. Increasing amounts of sodium lauryl sulfate increase the negative charge of these particles. It is known that the cement suspensions are stabilized by adsorption of organic acids and organic salts on the surface of the cement particles. The addition of potassium lauryl sulfate to a suspension of cement particles increases the zeta potential of the cement particles proportionally with increasing concentration of potassium lauryl sulfate. This ability with increasing zeta potential to grow. The rate of sedimentation of the suspended cement particles is retarded and hence the stability of the suspension increases by increasing the concn. of I in the suspension (0.0 g. of cement suspended in 400 cc. of H<sub>2</sub>O). Stabilization of the suspension is due to adsorption of lignosulfonic acid ions and I micelles on the surface of the cement particles. By such a process the hydrated layer covering the particles is reinforced. The increase of the stability is due to slight change in the nature of the forces of interaction between the cement particles. The interaction force grows as indicated. The rate of

also a cause of wood decay.  
Besides abietene t.c. and certain aromatic compounds, other substances favor air retention of insect infests, e.g. hydrocarbons predominantly of the resin series found in pitch. Air retention is also favored by water.

Title: Change in Composition of Liquid Phase in the Cement-Water System

Original Publication: Dokl. L'vovsk. politekhn. in-ta, 1955, 1, No 2, 88-92

Abstract: Sulfite-alcohol vinasse lowers the concentration of lime in the liquid phase of the cement-water system, which prevents reduction in strength on mixing of such compounded binders as building gypsum -- Portland cement, anhydride cement -- Portland cement, flooring plastergypsum -- Portland cement, alumina cement -- Portland cement, alumina cement -- lime. Thermographic analysis, determinations of chemically combined water, volumetric weight and free lime, have shown a change in composition of the hydration products of Portland cement, due to action of sulfite-alcohol vinasse and calcium chloride.

TITLE: Concrete Made From Cement Based on Iron-Clay (Beton na  
zhelezisto-glinitnom tsemente).

PERIODICAL: Beton i Zhelezobeton, 1958, Nr.11, pp.434-435 (USSR)

ABSTRACT: Cement based on iron-clay could be used for ordinary, air-entrained, no-fine, and fine aggregate (sand) concretes. Crushing strength of concrete based on this cement is 1.5-2 times higher than the strength of concrete made with ordinary cement. Adhesion of iron-clay cement to reinforcement is sufficient to secure cohesion of the concrete and reinforcement. It is therefore possible to use this cement for reinforced concrete constructions. Iron-clay cement was investigated in the Department of Technology of Silicates of Lvov Polytechnic Institute (Kafedra tekhnologii silikatov L'vovskogo politekhnicheskogo instituta). This cement is obtained by finely grinding together 20% quicklime, 10-30% pyrite of slag and 50-70% pulverized brick or burnt clay. Highest intensity of

Card 1/3

SOV/97-58-11-9/11

**Concrete Made From Cement Based on Iron-Clay.**

hardening is achieved when steam curing takes place under a pressure of 6 atm or more. Mix of 1 : 3 of plastic consistency was investigated, and it was found that during 4-hour curing under 6 atm., the compression strength of the concrete articles varied from 200 to 500 kg/cm<sup>2</sup>, and the strength in bending from 50 - 100 kg/cm<sup>2</sup>. The concrete mix was prepared in a plastic consistency with a water/cement ratio of 0.5, and 325 kg cement per m<sup>3</sup> of concrete. The concrete was mixed in the proportion of 1 : 2.2 : 4.2 (by weight). The strength of the concrete was tested using testing samples shaped as figure '8' with a waist cross-section of 15 x 15 cm and length of 60 cm. Further tests were carried out to establish the cohesion between the concrete and the reinforcement. The test cubes were 15 x 15 x 15 cm. and the reinforcement was of 12 mm diameter. Cohesion in concrete mark 200 and 150 reinforced with standard reinforcement was found to be 25 and 17 kg/cm<sup>2</sup> respectively. The advantage of concrete based on iron-clay cement is its strength in compression. Tests with this cement were carried out also in the factory for reinforced concrete constructions Dorstroytrest (Zavod

Card 2/3

SOV/97-58-11-9/11

**Concrete Made From Cement Based on Iron-Clay.**

betonnykh i zhelezobetonnykh konstruktsiy Dorstroytresta). air-entrained, concrete was prepared from iron-clay cement of activity 400 kg/cm<sup>2</sup>. Aluminium powder in the quantity of 400-600 g/m<sup>3</sup> was used to air-entrain the concrete. The resulting concrete weighed 600/1000 kg/m<sup>3</sup>, and its strength of compression was in the limits of 45-100 kg/cm<sup>2</sup>. No-fine concrete was prepared using aggregate of 30-40 mm and 120 kg/m<sup>3</sup> of iron-clay cement, with activity of 235 kg/cm<sup>2</sup>. This no-fine concrete weighed 1750 kg/m<sup>3</sup> and its strength in compression was 43 kg/cm<sup>2</sup>. Slabs from fine aggregate concrete were manufactured by the Dorstroytrest factory. When the mix was 1 : 5 of plastic consistency the blocks after curing had a strength in compression of 168 kg/cm<sup>2</sup>; with a mix of 1 : 9 the strength was 68 kg/cm<sup>2</sup>. These figures show that fine-aggregate concrete made from iron-clay cement is suitable for walling units. There is 1 table.

TITLE: Iron-Slate-Cement (Zhelezist-slantsevyy tsament)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Khimiya i khimicheskaya tekhnologiya, 1959, Nr 2, pp 394-397 (USSR)

ABSTRACT: A new binding material, the iron-clay-cement, which surpasses the Portland-cement with regard to strength, frost resistance and other technical characteristics, has been developed at the Chair mentioned under Association. The disadvantage in the production of this iron-clay-cement lies in the fact that the clay component must be burned at 800 degrees. The present article reports on a binding material, which predominantly consists of a material that does not require burning. Menilite-slate from Vyzhnitsa was used for the experiments. The mixture of the cement raw-material consisted of limestone, pyrite cinders and menilite-slate. The analysis data of the raw-materials are shown in table 1. Based on the experiments, the proportion limestone : slate was chosen as 1 : 3. The stress-values when adding 0 - 20% pyrite cinders, are shown in table 2. The compressive strength increases from 220 kg/cm<sup>2</sup>.

Card 1/2

SOV/156-59-2-45/48

Iron-Slate-Cement

(at 0% cinders) to 452 kg/cm<sup>2</sup> (at 15% cinders). In table 3, the stress-values of samples which were left setting for 28 days at room-temperature, are compared with those which were hardened with steam of 4 kg/cm<sup>2</sup>. When hardening with steam, aluminum-iron-hydrogranates and zeolites as well as fibrous calciumsilicate are formed. The tensile strength and the bending strength is 1.5 - 2 times higher as in the case of Portland-cement. There are 4 tables and 7 Soviet references.

TITLE: Effect of warm-moist treatment on the change in phase composition of Portland cement

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1961, 3:5 - 3:6,  
abstract 19K311 (Dokl. Mezhdunar. konferentsii po izuch.  
avtoklavn. materialov i ikh primeneniyu v str-ye, L., 1959,  
102 - 109)

TEXT: The authors studied changes in the composition of hydrosilicates and hydroaluminates of calcium under conditions of warm-moist setting by means of DTA methods, microscopic and electron-microscopic analyses. Primarily,  $C_2SH_2$ , lime, and some CSH are formed by hydration of  $C_3S$  in a moist room. Steaming at atmospheric pressure accelerates the crystallization of hydrosilicates.  $\alpha$ - and  $\beta$ -hydrates of  $C_2SH_2$ , lime, tobermorite, and afillite are formed by steaming. Then the amount of  $\alpha$ -hydrate increases. After 7 hr steaming,  $C_3S$  can be observed in aqueous suspension,

Card 1/3

S/081/61/000/C 5/054/085

B:17/B110

## Effect of warm-moist treatment...

with the electron microscope, in the form of spherolites and needle crystals. In alcoholic suspension, it has the form of rhombic and rectangular plates. After prolonged steaming, the sensitivity of hydro-silicates to the suspension decreases. After 35 hr steaming, mainly rectangular plates are observed, while the number of rhombic plates decreases strongly.  $C_2SH_2$ - $\alpha$ -hydrate is mainly formed by hydration of  $C_2S$  under conditions of warm-moist treatment. Other hydrates are present in small quantities. The resulting hydrosilicates are less subject to hydrolysis in water than the hydration products of  $C_3S$ . The hydration product of pure  $C_3A$  is cubic  $C_3AH_6$  under any conditions of setting. In cement paste, solution, and concrete,  $C_3A$  yields hexagonal hydroaluminates and  $Al(OH)_3$  gel by hydration under conditions of warm-moist treatment. The composition of hydration products of pure  $C_4AF$  is not changed by warm-moist treatment. In paste, solution, and concrete, however, i.e., with elimination of the hydration heat, hexagonal hydroaluminates and a colloidal mass are formed instead of the cubic ferric hydroaluminate.

Card 2/3

Effect of warm-moist treatment...

30217  
S/081/61/000/019/054/085  
B117/B110

Spherolites are only observed when stirring C<sub>3</sub>A and C<sub>4</sub>AF preparations with water. In Portland cement setting at room temperature, no interaction between clinker minerals takes place during the first period. It only begins after prolonged setting and at elevated temperature. The increase in strength of cement stone due to hydrothermal treatment can be explained by the change in phase composition of hydrosilicates and a slightly more accelerated crystallization of newly formed structures.

AUTHOR: Popov, G. A., Tikhonov, V. B.

TITLE: Various approaches to defining the magnetic Reynolds number and the limited scope of univariate approximations of  $Re_m$  for a flow of conducting gas

SOURCE: Soveshchaniye po teoreticheskoy i prikladnoy magnitnoy gidrodinamike. 3d, Riga, 1962. Voprosy\* magnitnoy gidrodinamiki (Problems in magnetic hydrodynamics); doklady\*soveshchaniya, v. 3. Riga, Izd-vo AN LatSSR, 1963, 5-8

TOPIC TAGS: magnetic Reynolds number, turbulent gas flow, laminar gas flow, electrically conducting gas, gas magnetodynamics, conducting gas flow, Reynolds number

ABSTRACT: The authors analyze several definitions of  $Re_m$  and show that for a turbulent flow it is definable as the ratio of magnetic field "carry-off" (by the flow) to the rate of magnetic field diffusion into the flow. They criticize definitions given by various authors in relation to laminar flows: specifically, that  $Re_m$  is the ratio of induced current to current required to develop a given external magnetic field at a single coil turn, that it is the ratio of the plasma current-induced magnetic field to an applied external magnetic field, and that it characterizes the ratio of inertial forces to electromagnetic body forces. Their analysis indicates the limited scope imposed by such de-
