SOV/4338

Timofeyev, Pavel Vasil'yevich

Smazochno-ochlazhdushchiye zhidkosti primenyayemyye pri rezanii metallov
(Lubricating and Cooling Fluids Used in Metal Cutting) Moscow, Mashgiz,
1960. 114 p. 7,000 copies printed.

Reviewer: V.S. Radchik, Candidate of Technical Sciences, Docent; Ed.: M.S. Soroka;
Chief Ed. (Southern Division, Mashgiz): V.K. Serdyuk, Engineer.

PURPOSE: This book is intended for technical personnel of machinery-manufacturing
plants working in metal cutting.

COVERAGE: The author presents information on lubricating-cooling fluids used in
the machining of metals and discusses their effect on the physical and process-
ing characteristics of metal cutting. Special attention is given to problems of
selecting lubricating-cooling agents for different types of machining and to re-
cently developed efficient methods of cooling and lubrication. The author thanks
Academician P.A. Rebinder for his advice and suggestions. There are 28 refer-
ences, all Soviet.

AUTHOR: Timofeyev, P. V. (Engineer)

TITLE: Effectiveness of applying lubricating-cooling substances to mechanical
working of a heat resistant alloy

SOURCE: Mashinostroyeniye, no. 5, 1965, 33-35

TOPIC TAGS: lubricant, lubricant filler additive, alloy, steel, wear resistance,
coolant/ EI765 alloy

ABSTRACT: A detailed investigation was carried out to evaluate the effectiveness
of applying oil-coolants to cutting tools during the cutting process of heat
resistant alloys such as EI765 (nickel base). A total of 30 lubricant-coolant
compounds was tested with various additives, such as chlorine, phosphorus, and
sulfur. Two indices of comparison were used: decrease in the P_y component of
the cutting force, and decrease in cutter wear over a period of 30 seconds. Forces
were measured using wire counters and a dynamometer. The force test showed that
the cooling effectiveness of the lubricants increases when one substitutes fatty
oils or fatty alcohols in place of oleic acids. At 22.7 m/min cutter speeds most

Card 1/2

L 2896-66

ACCESSION NR: AP5023347

of the lubricant-coolants used had little effect on the instrument wear, with the exception of water-activated fluids. In general, the best antifriction lubricant-coolants were found to be those oils that contained chlorine and sulfur additives. It is concluded that the most effective lubricant-coolant would be a synthetic system consisting of a water solution with chlorine and sulfur as additives. Orig. art. has: 2 tables.

Effect of the Coolant on the Quality of the Machined Surface.
P. V. Timofeev. (Stanki i Instrumenty, 1952. (9). 31-32).
[In Russian]. The results are presented of an investigation
of the effect of cooling-lubricating fluids on the extent of
transverse surface-roughness in the machining of a structural
steel, a tool steel, and a heat-treated heat-resisting steel. The
following fluids were used: Paraffin; paraffin + 0.2% oleic
acid; paraffin + 0.5% olive oil; an emulsion containing
2% sulphonated castor oil + 0.5% soap; and an oil mixture.
The effectiveness of the different fluids in producing smoother
surfaces is compared for the various steels and machining
speeds.—S. X.

TITLE: The Effects of Lubricating and Cooling Agents on the Steel Cutting
Process

PERIODICAL: Nauchn. zap. Khar'kovsk. in-t mekhaniz. s.kh., 1958, No. 8,
pp. 31-41

TEXT: The author presents results of an experimental investigation of the
effects of lubricating and cooling agents (50% sulfofrezol, 10% boiled oil and
40% turpentine) on the characteristics of the cutting process. The tests were
carried out during the free cutting of steel with three P18 (R18) high-speed
steel cutting tools with a plane front edge and the following geometry: $\gamma = 0^\circ$,
 $10^\circ, 20^\circ, 30^\circ, 40^\circ$; $\alpha = 8^\circ$; $\lambda = 0^\circ$. The thickness of the layer to be cut off
was between 0.05 and 0.25 mm, the cutting speed was 3 m/min. The cutting stresses P_z and P_y were determined by a two-component dynamometer with wire resistance

Card 1/2

A004/A001

The Effects of Lubricating and Cooling Agents on the Steel Cutting Process

pickups, the non-uniformity of the cutting process by a loop oscillograph, the hardening of the material was measured with the aid of the Khrushchev-Bertkovich device by the coldhardening - X-ray method, while the surface finish was determined with the aid of the Linnik double microscope. It was found that the use of lubricating and cooling fluids promotes the conversion of the elemental chip into a continuous one and reduces the chip curling radius. Besides, it facilitates the plastic deformation of the metal, reduces the chip hardness by 30-40% and its shrinkage, considerably lowers the cutting stresses, reduces the friction force and the normal force at the tool front edge, attenuates the irregularity of the cutting stresses and reduces their dependence on γ . The right selection of lubricating and cooling agents makes it possible to increase the efficiency of the cutting process, reduce the wear of the tool and machine tool, and improve the surface finish by 1-2 classes. There are 10 figures.

AUTHOR: Timofeyev, S.M.

TITLE: Reliability of silicon solar batteries for supplying dispersed telemechanical control installations

PERIODICAL: Akademiya nauk Uzbekskoy SSR. Izvestiya. Seriya tekhnicheskikh nauk, no. 5, 1961, 18-24

TEXT: The applicability of silicon solar batteries for supplying unspecified telemechanical equipment for irrigation, gas, and oil installations in sparsely populated areas of (Soviet) Central Asia was investigated as a result of the conclusion that this form of supply was more reliable and economical than other devices for utilizing solar energy or the conventional low-voltage power distribution system. The investigation was started with an examination of the atmospheric and solar-radiation data for the town of Tashkent. It was found that for this locality, the average number of cloudy days per year is <40 with the longest uninterrupted cloudy period of 8.65 days. The intensity of solar radiation in

Card 1/4

X

D249/D302

Reliability of silicon ...

winter is 2000 Kcal/m²/day and in summer it reaches 8500 Kcal/m²/day. These two figures are the limits of the quoted frequency distribution curve which was compiled for a period of 25 years. The 50% value on this curve corresponds to 4800 Kcal/m²/day. Two similar batteries were used in the comparative exposure tests designed to show the additional benefit of equipping the battery with auxiliary equipment consisting of light-condensing mirrors and a sun-tracking device. The tests were carried out between 11 and 17 hours, during which period outputs of up to 2.6 W were recorded. The results of the tests are tabulated and shown on graphs which indicate a 3-5 times increase in the battery output due to the use of the auxiliary equipment. The consumption of the tracking device was low, about 0.35% of the total energy produced. Another series of tests was made to investigate the behavior of solar batteries exposed to low-intensity radiation. This problem is of interest since the charging efficiency of the conventional accumulator working in parallel with the battery is voltage dependent. Alternatively stated, it is important to know the validity limits of the equation X

Card 2/4

Reliability of silicon ...

29650
S/167/61/000/005/001/003
D249/D302

$$P = kS\bar{\Phi} \odot$$

(3)

P - power developed by photo converter, S - battery active area,
 $\bar{\Phi}$ - luminous flux; k - battery dependent coefficient. It was
found that for the battery under investigation, the lower limit of
intensities for which Eq. (3) is fulfilled is 105 W/m^2 . If radia-
tion values below this limit are to be utilized, the solar battery
has to be equipped with additional charging-voltage control de-
vices. The relations between the quantities investigated in these
tests are shown graphically. The last two tests made concerned
the behavior of the battery under natural air pollution conditions
and its weather ability. In the first test the outputs of two bat-
teries were measured after 45 days of exposure, just before and
after cleaning. The batteries were located near a road, one placed ✓
horizontally, and the other slanting. The reductions in the power
output of these two batteries due to the pollution amounted to

Card 3/4

Reliability of silicon ...

29650
S/167/61/000/005/001/003
D249/D302

approximately 14 and 7% respectively; These two figures correspond to the discontinuity, due to the cleaning, on the recorded graph of power v. hours. In the second test the batteries were exposed unattended for 10 months during which period the temperature varied from below freezing point up to 95°C. Apart from a few minor constructional defects, no deterioration has been observed. The author's final conclusions are that in view of their low maintenance costs and reliability under all weather conditions, the solar batteries equipped with auxiliary devices are suitable as power generators for unattended telemechanical equipment in (Soviet) Central Asia. There are 4 figures, 1 table and 3 Soviet-bloc references. X

TIMOFFYEV, T., (Engr-Lt Col)

"Increase the Emission of Jet / Aircraft / Materiel Textbooks" - Engr-Col M. Nemirovskiy, Engr-Lt Col T. Timofeyev, Engr-Capt V. Dolgorukov, and Engr-Sr Lt V. Starostin complain of the shortage of textbooks and manuals on jet aircraft materiel. Those textbooks which are available, in the estimation of these officers, are not satisfactory, and the good textbooks are too few in number. They state that in 1953 a group of officers from the Air Force Engineering Academy imeni Zhukovskiy prepared a textbook, but so few copies of the first part were printed that it has now become a rarity. They call on the Military Publishing House (Voyenizdat) and the State Publishing House of the Ministry of Defense USSR (Oborongiz) to rectify these shortages. (Krasnaya Zvezda, Moscow, 13 Apr 54).

Abstract : Courier variety is the most suitable for industrial planting purposes. To increase the total yield and to obtain an earlier harvest, potato tubers were grown for 20 days in moist humus (additionally, after a 20-day light vernalization). Germination of the grain material added 16-44 percent to the harvest in the course of 3 years and hastened the maturity period by 7-10 days. -- M. F. Sokolova

SOV/92-58-7-14/37

AUTHOR: Timofeyev, V.A., Engineer

TITLE: Our Experiments in Redesigning the Combined Unit (Nash opyt
rekonstruktsii kombinirovannoy ustanovki)

PERIODICAL: Neftyanik, 1958, Nr 7, pp 14 - 16 (USSR)

ABSTRACT: In 1945 a combined unit was put on stream at the Kuybyshev refinery. This unit included the straight-run petroleum distillation section yielding gasoline, ligroin and semi-mazout, the reforming section processing ligroin, and the two-furnace thermal cracking section processing semi-mazcut. Since that time the flow scheme of this unit has been revised on several occasions, and it now operates as shown in Fig. 1. The author indicates in detail the route of the desalted crude oil proceeding through various apparatus of the unit, however, certain shortcomings were revealed during the operation of the unit. For instance, the insufficient capacity of the straight-run section, which yielded only gascline and a certain quantity of

Card 1/2

Our Experiments in Redesigning the Combined Unit

SOV/92-58-7-14/37

Ligroin, adversely affected the normal course of the process. It was difficult to establish optimal conditions for cracking the wide fraction of semi-mazout, and as a result heavy carbon deposits coated the mild cracking furnace pipes which often burned through. Moreover, the low pressure evaporator with six cascade trays could not ensure an efficient fractionation during the cracking process. In view of the above-mentioned shortcomings and some other defects, it has been decided to modify the combined unit as follows: a new straight-run section with more powerful furnace and atmospheric tower was installed instead of the old one, which was utilized exclusively for the primary evaporation of crude oil; moreover, the low-pressure evaporator of the old type was replaced by a new evaporator provided with a condensing and cooling system. As a result of these modifications, the redesigned unit now operates as shown in the flow diagram of Fig. 2. In a table the author gives the operational characteristics of the redesigned unit which was further modified later to reduce carbon deposits accumulating in various pipes. The hot feed circulation carried out to warm up the thermal cracking section was also changed as explained by the author and indicated in Fig. 3 and Fig. 4. These modifications improved operating conditions of the unit, increased its throughput by 30 percent and the yield of light products by 3 percent. There are 4 figures and 1 table.

TITLE: Multichannel device for recording motor activity in small laboratory animals (rats and mice)

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 59, no. 6, 1965, 114-116

TOPIC TAGS: bioinstrumentation, electronic equipment, rat, mouse, pharmacology

ABSTRACT: The authors modified Knoll's method, which involves the animal moving along a corridor and successively closing a circuit consisting of metal plates connected to the ground and a control grid of a radio tube that functions as an amplifier. Each movement of the animal from plate to plate triggers a pulse counter. The proposed modification entails the use of plates of different sizes - large for rats and small for mice. The individual activity of 20 mice and 10 rats can be recorded simultaneously, a valuable feature for mass pharmacological trials of new drugs.

The article summarizes the results of measuring spontaneous motor activity in mice and rats under normal conditions and after the injection of amphetamine sulfate and chlorpromazine. Use of the proposed device makes it possible to study a great many animals. The results lend themselves to statistical processing. The method is simple and reliable. This paper was presented by Active member AMN SSSR V. V. Zalusov. Orig. art. has: 1 fig. and 2 tables. JPRS

TITLE: Thermodynamics of reactions producing rare earth hexaborides
SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 9,
1965, 1513-1520

TOPIC TAGS: rare earth, thermodynamic calculation, heat of formation,
free energy, boride

ABSTRACT: The authors made a thermodynamic calculation of the reactions forming rare earth hexaborides in the vacuum thermal reduction of rare earth oxides with boron, boron carbide, and a boron-carbon black mixture. Heats of formation of the hexaborides were obtained by an approximate thermodynamic calculation for standard conditions and the heats of formation of the oxides were calculated from comparison. Calculations were based on A. F. Kapustinskiy's thermochemical logarithmic curve

$$\frac{\Delta H_f}{w} = a \ln z + b$$

TITLE: The Polishing of Parts on a Centerless Grinding Machine
(Polirovaniye detaley na bestsentrovo-shlifoval'nom stanke)

PERIODICAL: Mashinostroitel', 1958, Nr 12, pp 25 - 26 (USSR)

ABSTRACT: A new mechanized method of grinding and polishing on a centerless grinder, of circular "DLT" aluminum alloy parts 30 mm in diameter and 900 mm length, was introduced into practical use. Grinding and polishing is carried out by two operations with the use of special grinding or polishing disks. The first operation (grinding) is performed with the driving disk and the second operation (polishing) with the driving and polishing disks. They are of similar design, but the grinding disk is coated with an abrasive layer. The smoothness of the polished surface is equal to that obtained be a polishing machine. The technological process and the setting of the device are simple and do not require highly qualified workers. There are 3 diagrams.
