Naphthene Series Over an Aluminosilica Catalyst,"  
I. N. Tits-Skvortsova, A. I. Leonova, S. Ya. Le-  
vina, Moscow State U imeni M. V. Lomonosova.

"Dok Ak Nauk SSSR" Vol 84, No 4, pp 741-743

Cyclopentanethiol and cyclohexanethiol do not  
behave alike over an aluminosilica catalyst at  
300°. Cyclopentanethiol, losing a mol of H<sub>2</sub>S,  
becomes cyclopentane. The end product of

232TII

cyclohexanethiol is methylcyclopentane. Apparently,  
the following process takes place: cyclohexane-  
thiol, losing an H<sub>2</sub>S mol, becomes cyclohexane;  
cyclohexane isomerizes into methylcyclopentane which  
hydrogenates to methylcyclopentane. Dicyclopentyl  
sulfide becomes cyclopentane over an aluminosilica  
catalyst at 300°, the sulfur leaving the mol in  
the form of H<sub>2</sub>S. Dicyclopentyldisulfide is reduced  
over an aluminosilica catalyst at 300° as a result  
of destructive hydrogenation into cyclopentane  
thiol, part of which, losing a mol of H<sub>2</sub>S, turns  
into cyclopentene.

232TII

*TITUS SKVORTZOV 12/21/42*

Catalytic transformations over aluminosilicate catalyst of *p*-thiocresol, diphenyl disulfide, *p,p'*-ditolyl disulfide and 2,6-dimethylthianthrene. I. N. Titus-Skvortsova, A. I. Leont'eva, S. Ya. Levin, and T. A. Kurnosova (M. V. Lomonosov State Univ., Moscow). *Sbornik Statej Obrabotki Khimi., Akad. Nauk S.S.R.*, 1, 611-7 (1953).—The aromatic S derivs. listed above on contact with aluminosilicate catalyst at 300-500° suffer the most characteristic reaction of destructive hydrogenation. Thus, *p*-MeC<sub>6</sub>H<sub>4</sub>SH changes in part to MePh; 2,6-dimethylthianthrene is not formed. Ph<sub>2</sub>S yields 2 moles PhSH, the latter then being converted to C<sub>6</sub>H<sub>6</sub> and thiophene. (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>S<sub>2</sub> at first yields *p*-MeC<sub>6</sub>H<sub>4</sub>SH, which then is converted to MePh. 2,6-Dimethylthianthrene is totally decompr., yielding MeC<sub>6</sub>H<sub>4</sub>SH and being in part converted to C and H<sub>2</sub>. Reduction of *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl with Zn dust in iced H<sub>2</sub>SO<sub>4</sub> at 0° gave 78.6% *p*-MeC<sub>6</sub>H<sub>4</sub>SH, m. 43%; a 23.8% yield was obtained from *p*-MeC<sub>6</sub>H<sub>4</sub>Mel and S after 2 hrs. refluxing, along with a low yield of (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>S, m. 178-80°, m. 41.6-5° (from MeOH). Ph<sub>2</sub>S, m. 80° was obtained in poor yield from PhMgBr and S<sub>2</sub>Cl<sub>2</sub> in Et<sub>2</sub>O, along with much Ph<sub>2</sub>SH and PhBr. (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>S<sub>2</sub>, m. 47°, was obtained in 30.4% yield from 46 g. *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl and 30 g. *p*-MeC<sub>6</sub>H<sub>4</sub>SH in Et<sub>2</sub>O in the presence of 38.3 g. powd. KOH. Stirring 30 g. *p*-MeC<sub>6</sub>H<sub>4</sub>SH with 200 ml. concd. H<sub>2</sub>SO<sub>4</sub> in an open flask 20 hrs. gave 15.2 g. 2,6-dimethylthianthrene, pure product, 15%, m. 117° (from EtOH).

*U.S.S.R.*

Synthesis and catalytic transformations of sulfur compounds of naphthalene series on contact with aluminosilicate catalyst. T. N. Tikhonova, A. I. Leonova, and S. Ya. Levin (M. V. Lomonosov State Univ., Moscow). *Sbornik Statei Obshchey Khim.* 2, 1135-13 (1953) — KOH (28.1 g.) in 125 ml. EtOH satd. with H<sub>2</sub>S with cooling and treated at reflux with 74.6 g. cyclopentyl bromide, then refluxed 1 hr. gave 52% cyclopentanethiol, b.p. 129-31°, n<sub>D</sub><sup>20</sup> 1.4830, d<sub>4</sub> 0.9550, and 5.9% dicyclopentyl sulfide, b.p. 133-4°, n<sub>D</sub><sup>20</sup> 1.5140, d<sub>4</sub> 0.9715. A 39.5% yield was obtained from cyclopentylmagnesium bromide and S. The pure thiol, b.p. 129.5-30.5°, n<sub>D</sub><sup>20</sup> 1.4871, d<sub>4</sub> 0.9551; the disulfide, b.p. 140.5-1°, n<sub>D</sub><sup>20</sup> 1.5182, d<sub>4</sub> 1.0540, formed in 5% yield from the Grignard synthesis. Cyclopentanethiol passed over aluminosilicate catalyst at 300° gave 33.1% cyclopentene, 10.5% unchanged thiol, 69.1% HS, a little CO<sub>2</sub>, 4.85% olefins, 5.6% O<sub>2</sub>, and 15.3% H<sub>2</sub>; the reaction was run in N stream. Reaction of cyclopentylmagnesium bromide with S gave 66% cyclohexanethiol, b.p. 88-9°, n<sub>D</sub><sup>20</sup> 1.4926, d<sub>4</sub> 0.9449, along with 3.4 g. corresponding disulfide, b.p. 165-8°, n<sub>D</sub><sup>20</sup> 1.5170, d<sub>4</sub> 1.0473. The thiol passed in N over aluminosilicate catalyst at 300° gave 43% (on catalyst obtained in 49% yield) methylcyclopentane, 9.4% unchanged thiol, and much H<sub>2</sub>S; the isolation of the hydrocarbon was preceded by treatment with 90% H<sub>2</sub>SO<sub>4</sub> to remove unsat'd. compds. (probably cyclohexene). Cyclohexane passed over the catalyst at 300° gave no change. Cyclohexene gave 27% methylcyclopentane and small amounts of methylecyclopentenes, along with aromatic substances. Cyclopentene over the aluminosilicate catalyst at 300° gave no reaction.

OVER

cation of cyclohex-1-ene-1,4-dione, with K<sub>S</sub> in BOH gave 2,4% diecyanogen sulfide, b.p. 131°, n<sub>D</sub><sup>20</sup> 1.5102, d<sub>4</sub><sup>20</sup> 0.9726. The sulfide, over long, with 6.3% cyclopentenone catalyst at 300° gave much H<sub>S</sub> and 0.97% dimethylaminosulfone catalyst and unreacted, and reaction of cyclohex-1-ene-1,4-dione with cyclohex-1-ene-1,4-dione, some cyclohexanone, and aromatic compounds, in low yield. Reaction of cyclohex-1-ene-1,4-dione with aromatic bromide with K<sub>S</sub>, followed by decompostion, of the intermediate complex with acetic acid-H<sub>2</sub>O at the same day (diluted 10 times) gave 4.5% diecyanogen sulfide, b.p. 138-140°, n<sub>D</sub><sup>20</sup> 1.5108, d<sub>4</sub><sup>20</sup> 0.9714, along with the corresponding third generation of cyclohex-1-ene-1,4-dione sulfide, b.p. 138-140°, n<sub>D</sub><sup>20</sup> 1.5108, d<sub>4</sub><sup>20</sup> 0.9714.

X cyclohexanonecaproate in hot MeOH gave 8.1% cyclohexane and 0.87% above sulfide, b.p. 131-133°, n<sub>D</sub><sup>20</sup> 1.5146, d<sub>4</sub><sup>20</sup> 0.9714.

Attempts to prepare the sulfide from cyclohex-1-ene-1,4-dione and solid K<sub>MnO\_4</sub> with Ag<sup>+</sup> or with Ag<sup>+</sup> bromine and solid K<sub>MnO\_4</sub>. To cyclohexanethiol in cyclohexylmercuric acetate, KOH was added an equal amount of 55% Ag<sup>+</sup>. KOH was taken in Et<sub>2</sub>O, washed with thiosulfate, and 10% NaOH. Give 8.0% diecyanogen sulfide, b.p. 130-131°, n<sub>D</sub><sup>20</sup> 1.5178, d<sub>4</sub><sup>20</sup> 0.9617. This passed over alumino-silicate catalyst at 300° gave 21.4% (ten equivalents) cyclopentene, 20.7% cyclohex-1-ene, 20.7% cyclohexane, and a little high boiling material of unknown nature. Oxidation of cyclohexanethiol with 1 equiv. O<sub>2</sub> iodine in EtOH gave 60% diecyanogen sulfide, b.p. 102-5°, n<sub>D</sub><sup>20</sup> 1.5118. To said, add. KOH at 0-5° was isolated a solid cyclohexylmercaptoanion, after 2 hrs. at 70° there was isolated cyclohexyl bromide; after 2 hrs., b.p. 119-120°, n<sub>D</sub><sup>20</sup> 1.5111. Cyclohexyl cyanogen sulfide, b.p. 119-120°, n<sub>D</sub><sup>20</sup> 1.5112. This passed over alumino-silicate catalyst, b.p. 67-70° cyclohex-1-ene, some S<sub>8</sub> (S<sub>8</sub> m.p. 93°), d<sub>4</sub><sup>20</sup> 0.9692. This passed over alumino-silicate catalyst, 5.8% diecyanogen sulfide, b.p. 131°, n<sub>D</sub><sup>20</sup> 1.5102, d<sub>4</sub><sup>20</sup> 0.9726. The sulfide, over long, with 6.3% dimethylsulfoxide-cyclopentane; no thiols, methylecyclohexene and methylcyclopentane; phenyl-, and 6.65-3.3-dimethylsulfoxide-cyclopentane, and cyclohexylcyclohexane were found. Thus in the reaction there is the formation of cyclopentene and free radicals, along with the products of addition of free radicals sulfuring from the cleavage of H<sub>S</sub>.

Organic Chemistry

Catalytic transformations over aluminosilicate catalyst of thiophenol, dithioresorcinol, thianthrene, and diphenyl sulfide. I. N. V. Skorytova, A. I. Lebedeva, S. Ya. Levina, and L. A. Kucherova (Moscow State Univ.). Zhur.

Khim. 23, 303-10 (1953).—The various S derivs. were passed over the  $\text{Al}_2\text{O}_3\text{-SiO}_2$  catalyst in N at space velocity 0.25. In all cases H<sub>2</sub>S evolution was noted. PhSH was used at 200°, 300°, and 500°. In all cases the catalyzate was a mixt. of liquid and solid products distributed as follows: at 200° C<sub>6</sub>H<sub>6</sub> 49.5, thianthrene 11.1, and PhSH 7.7; at 300° 42.2, 15.9, and 6.8% resp.; at 500° 30.3, 10-12.7, 14.6-17.7%, resp. Possibly more PhSH is retained by the catalyst at the lower than at the higher temp. (500°). Pure thianthrene m. 155° (from EtOH). CISO<sub>2</sub>H (1950 g.) heated with 195 g. C<sub>6</sub>H<sub>6</sub>, 2 hrs. at 150-60° cooled, and poured into ice, yielded 70.8% m-C<sub>6</sub>H<sub>4</sub>(SO<sub>2</sub>Cl), (29.2% pure), m. 61-1.5° (from petr. ether). This (75 g.) added to 180 g. Zn dust and 200 ml. H<sub>2</sub>O at 50°, then heated with 20 g. Zn 10 min. to 70°, cooled, treated with dil. HCl (1 kg. concd. HCl and 500 ml. H<sub>2</sub>O), then treated with 25 g. more Zn dust, stirred 2 hrs. at 20°, and the resulting ppt. extd. with Et<sub>2</sub>O gave 77.7% m-C<sub>6</sub>H<sub>4</sub>(SH), m. 28-8.5°, b<sub>1</sub> 123-8.5°. Passage of this (20 g.) over the catalyst at 300° gave 23.1% catalyzate contg. C<sub>6</sub>H<sub>6</sub> 23.8, PhSH 11.9, 25.3% thianthrene, and 52.1% H<sub>2</sub>S, along with CO<sub>2</sub> 0.26, O 1.3, and H 10.5% in the off-gases. Thianthrene passed over the catalyst at 400° yielded 22% catalyzate which gave 36% C<sub>6</sub>H<sub>6</sub>, some PhSH and 45% unchanged thianthrene. Addn. of 91 g. AlCl<sub>3</sub> to 177 g. C<sub>6</sub>H<sub>6</sub>, then 85 g. S<sub>8</sub>Cl<sub>4</sub> and 81.5 g. C<sub>6</sub>H<sub>6</sub> at 10-13°, stirring 1 hr. without cooling and 1.5 hrs. at 30-40°, treatment with ice, filtration of the org. layer, evapn., soln. in MeOH, and refiltration from S gave 76.8% Ph<sub>2</sub>S, b<sub>1</sub> 182.5°, n<sub>D</sub><sup>20</sup> 1.0312, d<sub>4</sub> 1.1100. This passed over the catalyst at 300° gave 50% catalyzate contg. C<sub>6</sub>H<sub>6</sub> 8, thianthrene 13.7, and Ph<sub>2</sub>S 55.2%; at 350° the yield was 50% with 20.6% C<sub>6</sub>H<sub>6</sub>, 14.8% thianthrene, and a trace of Ph<sub>2</sub>S; at 450°, 45% with 35.3% C<sub>6</sub>H<sub>6</sub> and 14.7% thianthrene; at 500°, 55% with 64.5% C<sub>6</sub>H<sub>6</sub> and 11.3% thianthrene. PhSH was detected by odor in all cases.

H.L.H.

TITS-SK VDR TSOVA, I.N.

Synthesis and catalytic transformations, on aluminosilicate catalyst, of  $\beta$ -thiotetralol,  $\mu$ -tetralyl nonyl sulfide,  $\mu$ -tetralyl cyclohexyl sulfide and  $\beta$ -tetralyl methyl sulfide. I. N. Tits-Skvortsova and T. A. Danilova (M. V. Lomonosov State Univ., Moscow). Zhur. Otschek Khim. 23, 1384-92 (1953); cf. Uchenye Zapiski Moskov. Gosudarst. Univ. 151, 283 (1951). — Passage of 1,2,3,4-tetrahydronaphthalene-2-thiol (I) over aluminosilicate catalyst at 300° in H<sub>2</sub>S gave 66% catalyzate and 21.3% H<sub>2</sub>S. Considerable free S was found in the catalyzate, along with 33.9% tetrahydronaphthalene, 27.9% C<sub>10</sub>H<sub>8</sub>, and 6.8% starting material. Reaction of C<sub>10</sub>H<sub>8</sub>Br with I, K salt (II), gave 68% 1,2,3,4-tetrahydro-2-naphthyl nonyl sulfide, b.p. 218.5-9.5°, n<sub>D</sub><sup>20</sup> 1.5370, d<sub>4</sub><sup>20</sup> 0.9671, which, passed over the catalyst as above, gave 69.7% catalyzate and 19.3% H<sub>2</sub>S. The catalyzate contained 26.8% tetrahydronaphthalene, 15.7% 1-nonenol, 12.4% I, 4.3% C<sub>10</sub>H<sub>8</sub>, and 3.8% nonyl mercaptan. The best yield (35%) of cyclohexyl 1,2,3,4-tetrahydro-2-naphthyl sulfide (III) (b.p. 187.5-8.5°, n<sub>D</sub><sup>20</sup> 1.5500, d<sub>4</sub><sup>20</sup> 1.0513) was obtained from cyclohexyl chloride and I Na salt, on heating 10 hrs. at 115-23°; cyclohexene was a by-product. Cyclohexyl bromide gave lower yield (27%) even with II. The sulfide, passed over the catalyst as above, gave 81.7% catalyzate and 27.95% H<sub>2</sub>S; the catalyzate contained 27.83% tetrahydronaphthalene, 18.48% I, 16.63% methyleclopentane, 6.96% C<sub>10</sub>H<sub>8</sub>, and 1% original sulfide. Reaction of MeI with II gave 74.67% 1,2,3,4-tetrahydro-2-naphthyl methyl sulfide, b.p. 155°, n<sub>D</sub><sup>20</sup> 1.5920, d<sub>4</sub><sup>20</sup> 1.0711. This, passed over the catalyst as above, gave 74% catalyzate and 5.50% H<sub>2</sub>S with 12.36% MeSH. The catalyzate contained 34.63% tetrahydronaphthalene, 30.30% C<sub>10</sub>H<sub>8</sub>, 15.58% MeSH, and 5.63% I. Tetrahydronaphthalene passed over the catalyst alone gave 1.4% C<sub>10</sub>H<sub>8</sub>, 2.0% alkanes (mostly CH<sub>4</sub>) and unchanged starting material; if the reaction is run in H<sub>2</sub>S stream 4.64% C<sub>10</sub>H<sub>8</sub> is obtained. III is unchanged on passage through an empty tube at 300°. G. M. Kosolapoff

Dzepits, M. S. *Kataliz*. Publ. 112. Izd-vo Akad. Nauk SSSR, 1965.

CH<sub>3</sub>S<sub>2</sub> (31 g) prepared from thiophosgene and methylmagnesium iodide was added to a suspension of 10 g of PhCH<sub>2</sub> and 1 g of MnO<sub>2</sub> in 100 ml of benzene. The mixture was heated at 100° for 1 hr, then cooled and washed with benzene. The product was dried and weighed. At 200° the result was similar. Thus the reaction in the first of direct hydrogenation with PhMe and MnO<sub>2</sub> using PhCH<sub>2</sub> and Me<sub>2</sub>SiCl as a solvent over the catalyst did not give 12.6% catalyzing fire at a temperature of 100°, whereas 12.6% H<sub>2</sub>S was detected. PhCH<sub>2</sub>S<sub>2</sub> passed over the catalyst at 300° gave a low yield of PhMe and  $\text{^3}\text{PHCH}_3$ , along with 10% H<sub>2</sub>S, the reaction thus proceeding through PhCH<sub>2</sub> radicals, which are partly reduced and partly converted

TITLE: Synthesis and Catalytic Conversion of Sulfurous ac- $\beta$  - Derivatives of Tetralin With an Alumo - Silicate Catalyster (Sintez i kataliticheskiye prevrashcheniya na alyumosilikatnom katalizatore sernistykh ac- $\beta$  - proizvodnykh tetralina)

PERIODICAL: Vestnik Moskovskogo Universiteta. Seria matematiki, mehaniki, astronomii, fiziki, khimii, 1958, Nr 2, pp 159-168 (USSR)

ABSTRACT: The ac- $\beta$  - tiotetralol decomposes into hydrogen sulphide, tetralin and naphthalene when it comes in contact with an alumo - silicate catalyster. In the presence of an alumo - silicate the 1,4 - dihydronaphthalene suffers a conversion of the type of the irreversible catalysis of Zelinskiy. The influence of the benzene ring of the tetralin on the stability of the combination of sulphur with the hexamethylen ring is expressed by the fact that this combination can be split more easily than the same combination in the molecule of the cyclohexylcyclopentisulphide. There are 32 references, 10 of which are Soviet, 12 American, 6 German, 2 Japanese, and 2 Italian.

TITLE: Synthesis and conversion of sulfurous tetralin derivatives on an aluminum silicate catalyst

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 22, 1961, 174, abstract 22Zh128 (Sb. "Khimiya seraorgan. soyedineniy, soderzhashchikhsya v neftyakh i nefteproduktakh", M., AN SSSR, 1959, 174-182)

TEXT: The isomeric thiotetralenes 4-(Ia), 5-(IIa), 1-(IIIa) and 2-thiotetralenes (IVa) were synthesized, along with their sulfides (Ib, c, IIb-g, IIIb, c, IVb-d). (Substitute b = nonyl, c = cycloheptyl, d = phenyl, e = methyl, f = decyl, g = cyclohexyl). The catalytic conversions occurring in conducting I to IV over the aluminum silicate catalyst (AC) at 300°C and a volume velocity of ~0.25 hr<sup>-1</sup> were examined. H<sub>2</sub>S is always separated in the catalysis. The catalyzates are fractionally distilled. Ia and IIa form tetralin (V) which is converted

Card 1/2

Synthesis and conversion of...

S/081/61/000/022/021/076  
B110/B138

into naphthalene. IVa forms a mixture of 1,2-(VI) and 1,4-dihydro-naphthalenes. IIa is thermally unstable and at 300°C forms VI in the absence of AC. The substances Ib, c, IIb, c, e-g decompose, the sulfur forming one of two bonds with the radicals. Ia or IIa and the appropriate RSH are separated. The two bonds are almost equivalent. In the case of IIa, the bond between S and the radical of V is broken, and thiophenol is separated. For IIIb, c and IVb-d, decomposition on the AC was only found where S is bonded with the V radical. The schemes proposed for I-IV decomposition are given. [Abstracter's note: Complete translation.]

fessor; Secretary: Ye. S. Balenkova, Scientific Worker;  
Editorial Board: Rep. Ed.: A. P. Platov; I. V. Gostun-  
skaya, I. N. Tsi-Sverdlova, L. A. Erivanskaya.

PURPOSE: This collection of articles is intended for the  
teaching staff of universities and schools of higher ed-  
ucation training specialists for the petroleum and petro-  
leum-refining industries.

Card 1/7

CONTENTS: The collection includes articles dealing with the  
present state of the petroleum industry, the scientific  
research problems in petroleum chemistry, the chemistry  
of petroleum, the composition of petroleum and petroleum  
products, the scientific principles of refining petroleum  
into motor fuels and lubricants, and the manufacture of  
synthetic products from hydrocarbon gases and petroleum.  
One article discusses the effect of chemical composition  
and additives on fuel combustion in jet engines. The ma-  
terial was presented at the Inter-University Conference  
on Petroleum Chemistry held at the Moscow State Univer-  
sity under M. V. Lomonosov November 26-28, 1955. No person-  
alities are mentioned. References accompany most of the  
articles.

TITLE:

On the Changes of the Individual Sulfur Compounds on the  
Alumosilicate Catalyst at 300 and 400°C

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya 2. khimiya, 1960,  
No. 3, pp. 61-65

TEXT: The authors studied the changes of various organic sulfur compounds caused by passing them above alumosilicate catalysts at 300 and 400°C. Reference is made to earlier papers of the authors in which the behavior of organic S-compounds at 300°C was studied with the same catalyst under the same conditions. The author of this paper attempted to determine the temperature effect on the catalytic reactions. The results are the following: At 300°C aliphatic S-compounds are divided into two parts each at the S-bond (decyl mercaptan → decene + H<sub>2</sub>S, dinonyl sulfide → nonyl mercaptan + nonene, dinonyl disulfide → 2 nonyl mercaptan). At 400°C these compounds are cracked under the formation of gasoline (boiling interval 35-155°C) with a 43-48.4% yield. The remaining part consists of

resinification products. At 300°C S-compounds of the naphthene series produce hydrocarbons which can be identified (Refs. 3,4) under cleavage of H<sub>2</sub>S. Because of the almost quantitative reaction process (76-94%) this class of substances was not studied at 400°C. From among the hydro-

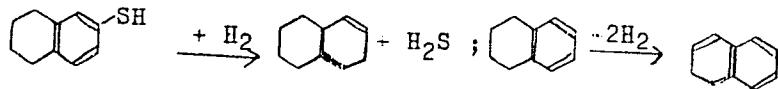

aromatics two isomeric  $\beta$ -thiotetraloles were studied with the SH group

(ar)  and/or in the alicyclic part (ac) . At 300°C the following was obtained from ar: 22% S (as H<sub>2</sub>S), 7% initial substance, 42% tetralin, 28% naphthalene. With ac the following was obtained: 95% S (as H<sub>2</sub>S), 45% tetralin, 40% naphthalene. With ar the following was obtained at 400°C: 98% S, (as H<sub>2</sub>S), 24% tetralin, 48% naphthalene. From ac 95% S (as H<sub>2</sub>S), 72% naphthalene were obtained. The authors explain these processes in the following way:

(temperature increase to 400°C promotes dehydrogenation).

Aromatic S-compounds proved to be the most stable. They are essentially changed only at 500°C (Ref. 7). 7) Thiophenol, benzene, diphenyl sulfide, benzene, thianthrene, thiocresol, toluene, n,n-ditolyl disulfide increase from 300 to 400°C (and/or 500°C) does not change the kind of the final products but only the quantitative ratios. Zelinskiy is mentioned. There are 1 table and 9 Soviet references.

TITLE: Synthesis and Conversions of ar- $\beta$ - and ac- $\beta$ -Tetralyl Phenyl Sulfides Over an Alumina-Silica Catalyst (Symbols ar and ac show that the substituents are in the benzene or in the hexamethylene ring of tetralin)

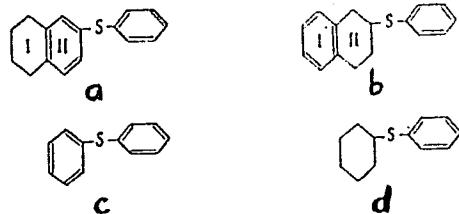

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 3,  
pp 962-966 (USSR)

ABSTRACT: In connection with previous studies (I. N. Tits-Skvortsova, S. Ya. Levina, A. I. Leonova, Ye. A. Karaseva, Uch. Zap. MGU, 132, 254, 1950, and others), two new sulfides of tetralin series were synthesized, and their conversions over an alumina-silica catalyst at 300° were studied. This work was undertaken in order to prove the mutually weakening effect of one tetralin ring on the sulfur bond in the second tetralin ring.

ceases, extract with ether, and distill over metallic Na under vacuum. ac- $\beta$ -Tetralyl phenyl sulfide (40.3%), bp 184.5-185.5° (3 mm),  $n_D^{20}$  1.6229,  $d_4^{20}$  1.1263, was obtained by the general method for mixed sulfides (F. Krüger, J. Pr. Ch., (2), 14, 206; 1876). Analysis of the products of catalytic conversion of ar- $\beta$ -tetralyl phenyl sulfide over alumina-silica catalyst at 300°, show that the conversion proceeds according to the assumed scheme:

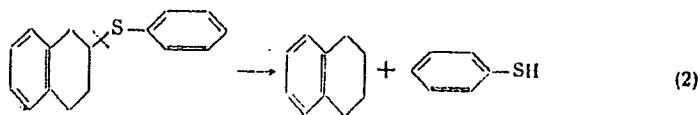

It was found that the conversion of ac- $\beta$ -tetralyl phenyl sulfide also proceeds according to the assumed scheme:

TITLE: Synthesis and Conversions of Sulfur Compounds of Naphthalene Series Over an Alumina-Silica Catalyst

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 3, pp 985-991 (USSR)

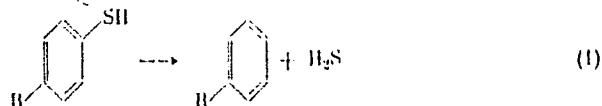

ABSTRACT: The following compounds were synthesized and their conversions over an alumina-silica catalyst at 300° was studied.  $\alpha$ -Thionaphthol (72%), bp 143-144° (6 mm);  $\beta$ -thionaphthol (80%), mp 79-80°;  $\alpha$ -naphthyl decyl sulfide (72%);  $\alpha$ -naphthyl cyclopentyl sulfide (45.6%), bp 168-168.5° (2 mm),  $n_{D}^{20}$  1.6419,  $d_{4}^{20}$  1.1193;

Card 1/5  $\beta$ -naphthyl decyl sulfide (68%), bp 209-219° (2.5 mm), mp 34-35°;  $\beta$ -naphthyl cyclopentyl sulfide (65%), bp 187.5-188° (4 mm),  $n_{D}^{20}$  1.6455,  $d_{4}^{20}$  1.1052. This

Catalyst

78297  
SOV/79-30-3-51/69

study was undertaken to see whether the conversions of the thionaphthols over the above catalyst at 300° proceed similarly to the conversions of aromatic thiols under the same conditions. Conversions of aromatic thiols proceed as authors showed (DAN SSSR, 80, 377, 1951; ZhOKh, 21, 212, (1951); and others), according to the following scheme:

It was found that both  $\alpha$ - and  $\beta$ -thionaphthols undergo an identical conversion over this catalyst at 300°, according to the following scheme:

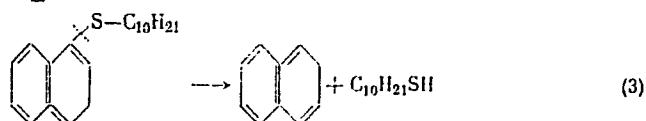

Card 2/5

Synthesis and Conversions of Sulfur Compounds  
of Naphthalene Series Over an Alumina-Silica  
Catalyst

78297  
SOV/79-30-3-51/69

Comparison of schemes 1 and 2 shows that the isomeric  $\alpha$ - and  $\beta$ -thionaphthols and aromatic thiols undergo similar conversions over the same catalyst at the same temperature.  $\alpha$ -Naphthyl decyl sulfide decomposes over the catalyst at 300° to form naphthalene (36%, of weight of catalyst), decyl mercaptan (13.1%), decen (7.8%), and H<sub>2</sub>S, according to scheme:

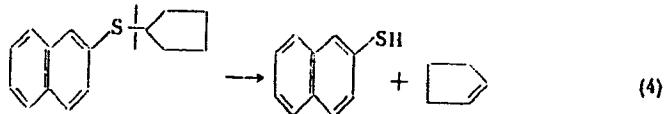

$\alpha$ -Naphthyl cyclopentyl sulfide decomposes over the catalyst to form naphthalene (40% of weight of catalyst), cyclopentanthiol (6.6%), dicyclopentyl sulfide (2.2%) and H<sub>2</sub>S. The reaction proceeds also analogously to scheme 3. Catalytic decomposition of  $\beta$ -naphthyl cyclopentyl sulfide under above conditions results in the formation of  $\beta$ -thionaphthol (15.6% of weight of catalyst), cyclopentene (10.2%),

Card 3/5

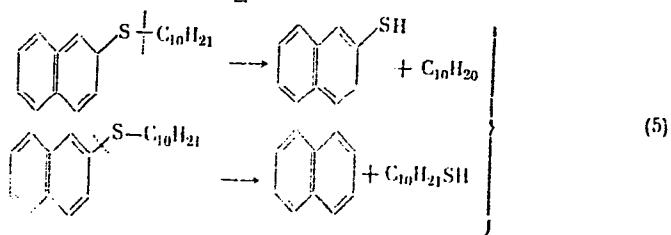

Synthesis and Conversions of Sulfur Compounds

TITLE: Synthesis and Catalytic Transformations of  $\alpha$ -Decyl  
Thiophane by Means of an Alumino-silicate Catalyst

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 10,  
pp. 3316 - 3319

TEXT: The authors synthesized the hitherto unknown  $\alpha$ -decyl thiophane (V) by applying the general method of synthesizing  $\alpha$ -alkyl thiophanes by R. D. Oboletsov and V. G. Bukharov (Ref.1). The present paper describes these data and contact transformations by means of an alumino-silicate catalyst. The following intermediates were obtained:  $\alpha$ -nonyl-furyl carbinol (I); ethyl ester of  $\gamma$ -ketotetradecanoic acid (II); 1,4-tetradecanediol (III); 1,4-dibromo-tetradecane (IV) (which have not been described as yet). They were synthesized in the following way: Compound (I) from furfurole according to Grignard, by the general method of synthesizing alkyl-furyl carbinols (Ref.2); compound (II) by boiling

$\alpha$ -nonyl-furyl carbinol in anhydrous alcohol to which HCl was added (Refs. 2 and 3); compound (III) by reduction of the ethyl ester of  $\gamma$ -ketotetradecanoic acid with lithium-aluminum hydride; compound (IV) by reaction of 1,4-tetradecanediol with dry HBr.  $\alpha$ -decyl thiophane (V) was obtained by reaction of 1,4-dibromo-tetradecane with  $\text{Na}_2\text{S}$  dissolved in alcohol. This reaction offers a good yield and gives a pure end product.  $\alpha$ -decyl thiophane decomposes on an alumino-silicate catalyst at 300°C to give hydrogen sulfide and tetradecene-1. Unchanged  $\alpha$ -decyl thiophane was found in the catalyzate. The cleavage of  $\alpha$ -decyl thiophane may be illustrated by the following Scheme: X

TITLE: Conversion of organosulfur compounds of the  $\alpha$ - and  $\beta$ -naphthalene series in the presence of an aluminosilicate catalyst

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 9, 1962, 228, abstract  
Zh180 (St. "Khimiya seraorgan. soyedineniy, soderzhashchikhsya  
v neftyakh i nefteproduktakh. v. 4", L., Gostoptekhizdat, 1961,  
141 - 144)

TEXT: Contact conversions of organosulfur compounds of naphthalene as carried out at 300°C on an aluminosilicate catalyst under conditions described earlier (Zh. obshch. khimiya, v. 21, 1951, 242) are reexamined.  $\alpha$ - and  $\beta$ -thionaphthols ( $\alpha$ - and  $\beta$ -I) were synthesized for research,  $\alpha$ - and  $\beta$ -naphthyldecylsulfides ( $\alpha$ - and  $\beta$ -II) and  $\alpha$ - and  $\beta$ -naphthylcyclopentylsulfides ( $\alpha$ - and  $\beta$ -III) synthesized for the first time. It was found that under these conditions  $\alpha$ -I and  $\beta$ -I are converted to C<sub>10</sub>H<sub>8</sub> and H<sub>2</sub>S similarly to the thiophenols studied earlier the respective yields being 52 and 42%

by weight of catalyst. As established previously (see UCh, zap. MGU, v.151, 1953, 263), in the case of mixed sulfides of the  $C_6H_5SR$  type (R being an alkyl or cycloalkyl), the bond between the sulfur and R is always ruptured. In the case of  $\alpha$ -II, it was found that  $C_{10}H_8$  and  $C_{10}H_{21}SH$  are formed with further conversion of the latter to  $C_{10}H_{20}$  and  $H_2S$ .  $\beta$ -III also decomposes in the same way, forming  $C_{10}H_8$  and cyclopentanethiol with subsequent conversion of the latter to dicyclopentylsulfide and  $H_2S$ .  $\beta$ -III under these conditions decomposes to  $\gamma$ -I, cyclopentene,  $C_{10}H_8$  and  $H_2S$ . In the case of  $\gamma$ -II,  $\gamma$ -I,  $C_{10}H_{21}SH$ , a decene-decane fraction and  $H_2S$  were detected. Consequently the bond between the sulfur and the benzene ring in mixed sulfides is much more stable and was not ruptured in any of the cases examined. The bond between the sulfur and the  $C_{10}H_8$  in the  $\alpha$ -position is far less stable. The bond between the sulfur and the alkyl and naphthyl in the  $\beta$ -position is more stable than that between the sulfur and naphthene rings.

TITLE: Hydrogenolysis of sulfurorganic compounds on aluminum-cobalt-molybdenum catalyst

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1961, 190 - 191,  
abstract PZhKh28 (Neftekhimiya, v. 1, no. 1, 1961, 190 - 194)

TEXT. For the first time, conversions of thiolene, sulfides, and disulfides of the aliphatic and aromatic series on an aluminum-cobalt-molybdenum catalyst (AMC) were studied systematically in a static system at hydrogen pressure under conditions of partial hydrogenolysis. Decomposition diagrams of: (a) thiolene (n-nonyl mercantan and thiophenol), and (b) sulfides (di-n-nonyl sulfide and diphenyl sulfide) are suggested. According to diagram (a), the process takes place in two directions:  
 $RSH + H_2 \rightarrow H_2S + RH$  and  $2RSH \rightarrow H_2S + RSR$ . It was found that the hydro-

genolysis of sulfur compounds of the aliphatic and aromatic series proceeds according to similar diagrams. It was shown that some sulfur compounds were partly converted into other ones in the desulfurization on AMC and Card 1/3

Hydrogenolysis of sulfurorganic...

S/081/61/000/023/016/061

that hydrocarbons were the final product; sulfur was precipitated as hydrogen sulfide. The sulfur compounds used in this study were synthesized according to methods described in the literature (Titov, Skvorcova, I. N., et al., Zh. obshch. khimii, 21, 1951, 242; Zh. obshch. khimii, 24, 1953, 303. So. stazey po obshchey khimii, 1, 1953, 54) and characterized by the main constants. Constants of these compounds are also given on the basis of published data. Approximately 30 g of the substance investigated and 3 g of AMC are heated in the autoclave for 1 hr at 300°C. Initial hydrogen pressure is 40 atm. After cooling, H<sub>2</sub>S is absorbed in ammoniacal zinc sulfate solution. Some ether is added to the liquid catalyst, the catalyst is filtered off, and the catalyst is fractionated. Initial substance, conversion percentage, products obtained, and their yields in moles per 100 moles of converted substance are as follows: n-nonyl mercaptan (I), 65.0, H<sub>2</sub>S, n-nonane (II), di-n-nonyl sulfide (III), 58.9, 55.9, 14.5; thiophenol (IV), 72.1, H<sub>2</sub>S, C<sub>6</sub>H<sub>6</sub>, dicyclohexyl sulfide (V), 72.6, 70.8, 8.7; (III), 43.5, H<sub>2</sub>S, (II) (I), 52.2, 108.5, 30.2; (V), 57.0, H<sub>2</sub>S, C<sub>6</sub>H<sub>6</sub>; (IV), 73.5, 76.9, 10.1; di-n-nonyl disulfide,

TITLE: A formula for calculating phase shifts in the case of Thomas-Fermi and Hartree potentials

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43, no. 1(7), 1962, 87-88

TEXT: In the case of Thomas-Fermi and Hartree potentials, the formula

$$a_l = -\frac{4Z}{\pi} \sum_l c_l \int_0^{\pi/2} \frac{\varphi \cos(2l+1)\varphi}{\sqrt{(b_l/\mu)^2 + 8E \sin^2 \varphi}} \ln \frac{\sqrt{(b_l/\mu)^2 + 8E \sin^2 \varphi} + 2\sqrt{2E} \sin \varphi}{\sqrt{(b_l/\mu)^2 + 8E \sin^2 \varphi} - 2\sqrt{2E} \sin \varphi} d\varphi. \quad (7)$$

for small phase shifts  $\delta_1^{(1)} + \delta_1^{(2)} + \dots$  can be used to calculate the correction  $\delta_1^{(2)}$  to the Born shift  $\delta_1^{(1)}$ . This formula is convenient for practical calculations. The relation

$$\delta_l^{(1)} = \frac{Z}{\sqrt{2E}} \sum_l c_l Q_l \left( 1 + \frac{1}{2} \left( \frac{b_l}{\mu \sqrt{2E}} \right)^2 \right). \quad (6)$$

Card 1/2

S/056/62/043/001/014/056

B125/B102

A formula for calculating phase ...

describes the Born shift, and  $Q_l$  are Legendre polynomials of the second kind. The subscript  $i$  in (6) and (7) varies between 1 and 3, depending on the value of the atomic number. Its exact value can be found in: W. T. Byatt. Phys. Rev., 104, 1298, 1956. After the determination of  $a_l$  from (7)  $\delta_l^{(2)}$  can be calculated from

$$\delta_l^{(2)} = \frac{2}{\pi} \left( a_l - \frac{\delta_l^{(1)}}{2l+1} \right) \delta_l^{(1)}, \quad a_l = - \left( \frac{\partial \delta_p^{(1)}}{\partial p} \right)_{p=l+\frac{1}{2}}. \quad (5)$$

and (6). Eq. (7) is much better suited for  $l = 1, 2$  than the phase  $\delta_l^{(1)}$  derived by Born's method. There are 2 tables.

TITLE: Analytic method for an approximate determination of the eigenfunctions and energies of electrons in atoms

SOURCE: Optika i spektroskopiya, v. 17, no. 6, 1964, 805-808

TOPIC TAGS: Schrodinger equation, electron energy, eigenvalue, x ray line

ABSTRACT: The author solves the single-electron Schrodinger equation by using exact numerical values of the Thomas-Fermi function for a free neutral atom. The method of F. Rasetti (Rend. Lincei, v. 7, 915, 1928; Zs. Phys. v. 49, 546, 1928) is used to determine the eigenfunctions and energies of the electrons in the atoms. By using the derived formulas instead of the exact Thomas-Fermi functions rather than the approximate analytic equation as in the

L 14745  
ACCESSION NR: AP5000540

past) it becomes possible to calculate analytically the eigenvalues and the energies of the electrons in the deepest s, p, d, and f energy states. The x-ray terms obtained in this manner agree with those obtained experimentally as well as with those calculated by the Hartree method. Orig. art. has: 13 formulas and 2 tables.

TITLE: On the Methods of Born and Pais for the Detection of Phase Shifts (O metodakh Borna i Paysa dlya nakhozhdeniya fazovykh sdvigov)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 37, Nr 1, pp 294 - 295 (USSR)

ABSTRACT: It is a known fact that, in cases when Born's approximation is found to be useless for the detection of phase shifts, a more exact method, such as that of Pais, is used. The author of the present "Letter to the Editor" gives a short description of the two approximation methods with respect to the plane shifts; Born's and Pais' approximation formula for them are written down. In the following, the exactness of each of the two methods is compared for a concrete case, viz. for (n,p)-scattering at 100 Mev.  $V_0 = 45$  Mev and  $\alpha^2 = 0.266 \cdot 10^{26} \text{ cm}^{-2}$ . Results:

Pais' approximation  $\eta_1 = 0.534$   $\eta_2 = 0.221$

Born's approximation  $\eta_1 = 0.487$   $\eta_2 = 0.197$

Card 1/2 Second Born's approximation  $\eta_1 = 0.552$   $\eta_2 = 0.231$

On the Methods of Born and Pais for the Detection  
of Phase Shifts SOV/56-37-1-44/64

Pais' approximation thus gives much better results than the  
first of Born. There are 4 references, 1 of which is Soviet.

TITLE: Scattering of Electrons in the Thomas-Fermi Model

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 39, No. 5(11), pp. 1347-1348

TEXT: The author offers a calculation of the differential elastic scattering cross section of electrons using the statistical atom potentials as proposed by Latter (Ref. 1)

$$v(r) = \begin{cases} -(Ze^2/r)\Phi(x), & Z\Phi(x) > 1 \\ -e^2/r, & Z\Phi(x) < 1 \end{cases} \text{ in Thomas-Fermi approximation.}$$

( $\Phi(x)$  is the Thomas-Fermi function for the neutral atom). This ansatz for the potential yields more accurate energy values for the atom than the Hartree method. The author obtains for the differential cross section

$$I(\vartheta) = \frac{3^{8/3} h^4 Z^{2/3}}{2^{34/3} \pi^{4/3} e^4 m^2 R^2} \left[ \int_0^\infty \Phi(x) \sin Px dx + \frac{\cos Px_0}{ZP} \right]^2, \text{ where } \vartheta \text{ is the}$$

$$\text{scattering angle, } Z \bar{\Phi}(x_0) = 1, P = \frac{z^{2/3} h v \sin(\vartheta/2)}{2^{7/3} \pi^{1/3} e^2 z^{1/3}} = \frac{z^{2/3} h^2}{2^{7/3} \pi^{1/3} e^2 m_z^{1/3}} \frac{\sin(\vartheta/2)}{\lambda}$$

(v - electron velocity,  $\lambda$  - the corresponding wavelength). Using equation (5) for  $I(\vartheta)$  the cross sections are calculated for Ne, Si and S. In the table the values are compared with the results obtained by employing the Hartree method in first Born approximation. A more exact study showed that the results of both methods agree quite well for large Z but exhibit a large deviation for small values of Z. The author thanks Professor P. Gombash for his interest and Ya. Vatso for aid in the computations. There are 1 table and 4 references: 2 Soviet, 1 US, and 1 Japanese.

SOURCE: Neftepererabotka i neftekhimiya, no. 4, 1966, 19-21

TOPIC TAGS: antiseize additive, sulfurization, chloromethylation, sulfide sulfide

ABSTRACT: In order to determine the exact technological conditions of the process for the industrial production of the antiseize additive di(alkylbenzyl) disulfide (ABS-2) and to prepare an experimental batch of oil with the additive for extended performance tests, an experimental run was conducted on an experimental industrial unit. The synthesis usually consists of three steps: (1) chloromethylation of a mixture of aromatic hydrocarbons with Formalin and HCl; (2) reaction of the chloromethyl derivatives thus obtained with aqueous sodium sulfide to form di(alkylbenzyl) disulfide; (3) purification of the latter to remove active sulfur compounds. The results of the experimental industrial run indicate that the technological process of production of ABS-2 does not require any complex apparatus and can be carried out on typical chemical plant equipment in two stages: (1) chloromethylation producing alkylbenzyl chloride and (2) sul-

furization of the latter. The efficiency of the chloromethylation of aromatic hydrocarbons obtained from the heavy component of hydroforming is largely determined by the rate of stirring of their mixture with Formalin and concentrated HCl. In quality, the ABS-2 obtained with the experimental industrial unit is identical to the additive produced under laboratory conditions; however, its viscosity and density are higher.

TITLE: Investigation of the Radiation Flux Divergence of the 2537 Å Line  
in a Mercury Discharge (Issledovaniye divergentsii potoka izlucheniya  
linii 2537 Å v rtutnom razryade)

PERIODICAL: Optika i Spektroskopiya, 1958, Vol 5, Nr 1, pp 3-9 (USSR)

ABSTRACT: Under steady-state conditions the divergence of radiation at a given point is given by the difference in the number of collisions per unit time which excite atoms and the number of collisions which de-excite these atoms. If the excited atoms are not affected by secondary processes, such as collisions of the second kind or cumulative excitation, the radiation divergence (div G) should be proportional to the electron density ( $n_e$ ). In this case the curves of distribution of div G and  $n_e$  across the discharge tube should be similar. If the secondary processes are important then the curves of distribution of div G and  $n_e$  across the tube should be different. The authors investigated the 2537 Å line in a positive column of an arc discharge in low-pressure mercury vapours. Construction of the discharge tube was similar to that described by Klyarfel'd (Ref 4).

Investigation of the Radiation Flux Divergence of the 2537 Å Line in a Mercury Discharge

The discharge tube diameter was from 32-38 mm, the length of the positive column was 450-500 mm. Measurements were made at various pressures of mercury from  $2 \times 10^{-4}$  to  $1.5 \times 10^{-2}$  mm Hg and currents from 0.2 to 2.5 amperes d.c. A vibrating luminescent probe was used with its surface parallel to the discharge-tube axis. The vibrating probe method was described in detail by Titushina (Ref 6). Div G was calculated from the brightness of the probe emission, which was measured. Simultaneously with optical measurements the authors found the electron temperature and density using Langmuir and Mott-Smith probes. Fig 1 shows the distribution across the tube of the radiation divergence (black dots) and electron density (open circles). Both these quantities are given in the form of ratios of the value at a particular point to the value at the discharge-tube axis. At low pressures ( $5 \times 10^{-4}$  mm Hg) and  $\text{div } G / (\text{div } G)_0$  curve (subscript 0 denotes the value at the discharge-tube axis) falls faster at the tube walls than the  $n_e / n_{e0}$ . At pressures of the order of  $6 \times 10^{-3}$  mm Hg the two curves coincide, but at higher pressures ( $1.5 \times 10^{-2}$  mm Hg) the  $\text{div } G / (\text{div } G)_0$  curve falls more slowly than the electron density. The differences between the two curves indicate that in the pressure regions around  $10^{-4}$

\* Investigation of the Radiation Flux Divergence of the 2537 Å Line in a Mercury Discharge

and  $10^{-2}$  mm Hg secondary processes are important in the mechanism of excitation of atoms to the  $6^3P_1$  level. At pressures of the order  $10^{-4}$  mm Hg and discharge currents of 0.5 A the secondary processes intensified emission of radiation. At pressures near  $1.5 \times 10^{-2}$  mm Hg and discharge currents of 0.5 and 1 A different secondary processes are active and they quench resonance radiation. Fig 2 shows the dependence of the ratio  $\text{div } G/n_e$  at the discharge-tube axis on the current. Fig 3 shows the discharge current dependence of  $\text{div } G/n_e$  at a distance of 0.8 R (R is the tube radius) from the axis. In Figs 2 and 3 numbers 1, 2, 3, 4 refer to pressures of  $5 \times 10^{-4}$ ,  $3 \times 10^{-3}$ ,  $6.5 \times 10^{-3}$  and  $1.5 \times 10^{-2}$  mm Hg respectively. A short theoretical treatment of the observed effects is given. It relates the radiation divergence to the probability of primary excitation processes and the probability of secondary processes (intensification or quenching of emission) as well as to the electron density. It is concluded that the mechanism of excitation to the  $6^3P_1$  level is complex and it is determined by diffusion of radiation and the electron density. There are 3 figures and 6 Soviet references.
