Theory of Damping of Vibrations in Crystals. S. Tkachenko (Zhur. Eksp. Teoret. Fiziki, 1939, 9, (3), 314-334; Sci. Abstr., 1939(a), 42, 843).- (In Russian) T. gives a theory of the damping of vibrations which takes into account the non-linear forces between atoms, and discusses in detail the possibilities of damping both in a continuum and a discrete lattice. The role of dispersion in discrete crystals is calculated. T. criticizes Peierls' theory of thermal conductivity in crystals (Ann. Physik, (v), 8, 1055).

TITLE: A method for reproducing curved surfaces by mechanical duplication. Class 67, No. 190235 [announced by the Scientific Research and Technological Design Institute for Automation and Mechanization of Machine Building (Nauchno-issledovatel'skiy i proyektno-tehnologicheskiy institut avtomatizatsii i mekhanizatsii mashinostroyeniya)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1967, 145-146

TOPIC TAGS: metal machining, diamond, abrasive

ABSTRACT: This Author's Certificate introduces a method for reproducing curved surfaces by mechanical duplication. A feeler moves over a master form and transmits its own motion to a tool of identical profile. Provision is made for using a self-sharpening diamond tool regardless of wear by incorporating an auxiliary abrasive tool which periodically alters the shape of the feeler as the diamond tool wears.

PERIODICAL: Byulleten' izobreteniy, 1958, Nr 6, p 8 (USSR)

ABSTRACT: Class 5a, 17. Nr 113517 (575862/173-54 of 18 February  
1954). Submitted to the Ministry of Coal Industry  
of the USSR. A device with a cutting head connected  
directly with the armature shaft of an electric mo-  
tor. The cutters are placed in hollows in the cut-  
ting head so that no more than four cutters are cut-  
ting simultaneously. The device includes a guide roller  
and a thrust guiding it in relation to the top  
and sole of the coal seam.

"Intraossal Anesthesia in Surgical Interference on Extremities," Prof I. L. Krupko, A. V. Vorontsov, S. S. Tkachenko. Chair of Orthopedics, Mil Med Acad imeni S. M. Kirov, Leningrad

"Vest Khirurgii" Vol 72, no 5, pp 15-19

Describes intraossal anesthesia used at the academy since 1949. Advocates its use in military field practice. Enumerates the advantages of this method as follows: simplicity of procedure, satisfactory analgesic effect.

produced by the even distribution of the anesthetic soln through the blood vessels of the area restricted by the tourniquet. States that a marked lowering of the muscular tone, observed during this anesthesia, is favorable for work on closed fractures and sprains. States that correction of closed fractures and repair of sprained joints have been successfully performed under intraossal anesthesia. Notes that the disadvantage of this method is the necessity of applying a tourniquet and the rapid recovery of sensitivity after its removal.

"The Application of Metallic Osteosynthesis in Closed Bone Fractures After Total Experimental Irradiation," by Prof A. A. Nikitin and S. S. Tkachenko, Candidate of Medical Sciences, Chair of Orthopedics and Traumatology (head, Prof I. L. Krupko), Military-Medical Order of Lenin Academy imeni S. M. Kirov, Vestnik Khirurgii, Vol 77, No 6, Jun 56, pp 48-51

Tests conducted on 103 rabbits indicate that infliction of trauma in the form of hip fractures to irradiated experimental animals aggravates the course of radiation sickness, and delays the healing process by 25%. The application of metallic intramedullary osteosynthesis in treating closed bone fractures of rabbits subjected to the action of penetrating radiation but before the development of radiation sickness improves the general condition of the animals.

A simultaneous use of streptomycin and penicillin in rabbits subjected to irradiation and the operation of metallic osteosynthesis of closed hip fractures significantly improves their survival chances from radiation sickness, but the use of penicillin alone is less effective.

909. COURSE OF HEALING OF FRACTURES IN RADIATION DISEASE OF  
MIDDLE DEGREE (Russian text) - Tkachenko S. S. - ORTOP.  
TRAVM. I PROTEZ. 1958. 19/1 (24-25) Graphs 3 Illus. 8

In these investigations 151 rabbits of 1500-1800 g. weight were irradiated with 600 r., 98 of them without previous trauma, and the rest after having been traumatized by fracture 3-5 hr. before. The radiation disease took its usual course: the number of leucocytes in the peripheral blood diminished to about 2600 on the 3rd day, increasing again from the 5th day to attain a normal number on the 40th day. Microscopic examination of the fracture site revealed the following: in non-irradiated control animals on the 14th day formation of bone substance was observed; on the 21st day this formation was more differentiated and the fracture ends were connected by spongy bone; on the 42nd day distinct bone-trabeculae were seen, and a new bone-marrow space had also been formed. In animals both traumatized and irradiated necrotic bone tissue appeared between the fracture ends on the 14th day, there were large callus masses and healing was retarded; on the 35th day a thick, sponge-like bone-mass was seen, and on the 42nd day the differentiation of the new bone had progressed but no bone-marrow space had formed. In the traumatized and irradiated animals the death rate was somewhat higher; in a group of 18 irradiated control animals, 4 died, and of 54 traumatized and irradiated animals, 18 died. In general, the rabbits which had been irradiated only had a better prospect of survival than did the others which were both traumatized and irradiated.

4796. (1186) THE PROBLEM OF SPONDYLOLISTHESIS (Russian text)  
Tkachenko S. S. - ORTOP. TRAVM. I PROTEZ. 1958, 19/5 (30-43)

Tables 4 Illus. 7

Since 1950, 24 cases of spondylolysis without spondylolisthesis and 43 cases of spondylolisthesis of various degrees of severity have been studied. Stress is laid on the importance of the diagnosis of spondylolysis; the condition can be observed on lateral-projection radiograms and especially on stratigraphic examination. Spondylolisthesis is brought about by the presence of spondylolysis. Its occurrence is due not so much to a single trauma as to repeated microtraumata, a chronic traumatism with resulting degeneration of the disc and of the ligaments. The clinical picture of spondylolisthesis is described. Excellent results have been obtained with conservative treatment which consists essentially of immobilization in a corset and physiotherapy. The surgical treatment with posterior vertebral osteosynthesis has only limited indications; among 43 cases, only 3 were subjected to operation, with excellent results.

The nature of the phenomenon of difficult stripping of  
cathodic zinc. A. I. Levid, A. V. Ponomarov, and T. A.  
Tkachenko. *J. Appl. Chem. U.S.S.R.* 26, 1189-03 (1963).  
(Engl. translation). See C.A. 49, 782b. H. L. H.

"Nature of the Phenomenon of "Difficult Stripping" of Cathode Zinc. A. I. Levin, A. V. Ponomarov, and T. A. Tkachenko (*Zhur. Priklad. Khim.*, 1953, 26, (12), 1244). [In Russian]. In the electrodeposition of Zn from  $ZnSO_4$  soln. there are periods when the deposit is difficult to remove from the Al starting sheets. To investigate this, soln. contg. Zn 60,  $H_2SO_4$  100 g./l., with various fluoride contents, were electrolysed at 32° C. and cathodic e.d. ( $I_p$ ) = 400 amp./m<sup>2</sup>, using anodes and cathodes of sheet Pb and Al, resp. Stripping trouble occurred only when the F<sup>-</sup> content reached 300 mg./l., for cathodes used repeatedly, or >4000 mg./l. for new cathodes. Since the max. F<sup>-</sup> content of ordinary baths is 50 mg./l., the troubles experienced in practice are not solely due to the presence of F<sup>-</sup>, as was suggested by Zosimovich and Il'enko (*Tsvet. Met.*, 1949, (2), 51); in addn., experiments showed that the presence of a natural oxide film on the Al assists removal of the Zn. Increasing the F<sup>-</sup> concentration from 0 to 4000 mg./l. changed the electrode potentials of Al in  $H_2SO_4$  (100 g./l.) and in the acid  $ZnSO_4$  electrolyte from -0.230 to -0.939 and from -0.38 to -0.862 V., resp., but this was so only for the initial potential; the potential of Al in  $H_2SO_4$  after 2 hr. was ~-0.58 V. for any F<sup>-</sup> content within the range 0-4000 mg./l. The increased adhesion of the Zn is attributed to porosity in the oxide film or scratches, dents, cracks, and other defects in the metal surface. Microcells are set up, leading to the formation of intermetallic Zn-Al compounds in pits in the Al. This was confirmed by artificially producing adhesion by etching the Al surface or by amalgamating it. The reduction in current efficiency observed with amalgamated plates is explained by the intensive corrosion that occurs.

TITLE: Research in the field of azomethine dyes<sup>5</sup> VI. Azomethine dyes derived from 2-acylaminopyrazolones

CITED SOURCE: Kinotekhnika. Nauchno-tekhn. sb.. vy\* p. 4, 1963,  
103-116

TOPIC TAGS: organic derivative, dye, photographic emulsion, color film, sensitivity increase

TRANSLATION: A large number of azomethine dyes (AD) have been sensitized. These dyes are the color producing components of multilayer color films, and are of the class of derivatives of 2-acylamino-pyrazolones (5) with different acyl residues in the amino group. The

Card 1/2

L 6913-65

ACCESSION NR: AR4039920

photographic and optical properties of these azomethine dyes have been investigated, along with some properties of dyes obtained from them by color development (absorption spectra and stability). The introduction of the acyl residue into the amino group of the AD deepens their color, particularly in alcohol solutions. The absorption of the AD in gelatine emulsion is characterized by a hypsochromic shift of the absorption maximum compared with the alcohol solutions, and by a simultaneous broadening of the entire absorption band. Many investigated AD from the 1-aryl-3-acylaminopyrazolone series are quite active under color development and form highly stable dyes. The latter pertains also to AD from the series of 3-N-alkyl (aryl)-N-acylaminopyrazolones, but unlike the preceding series these AD have a small reactivity. Bibliography, 21 titles. A. Kartuzhanskiy.

TITLE: On the properties of masking color components of arylazo derived pyrazolones (5) and anilides of 1,2-oxyphthalic acid

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 86, abstract 3D584 ("Uspekhi nauchn. fotogr.", 1962, v. 8, 35 - 43)

TEXT: An investigation was made on the dependence of the color photographic properties of some arylazo derived pyrazolones and anilides of 1,2-oxyphthalic acid on the nature and position of the substitution agents in the arylazo-group. It is established that the phenyl derivatives of pyrazolones and of 1,2-oxyphthalic acid are compounds considerably less susceptible of reaction in the conditions of color developing than the initial purple and pale blue components. The entry of electropositive substitution agents into the phenylazo-group somewhat increases the reaction capacity of the components, the most favorable influence

Card 1/2

On the properties of masking color components...

S/058/63/CCO/003/045/104  
A062/A101

then being shown by the oxy-group in the position 4. Electronegative substitution agents in the phenylazo-group of masking pale blue components cause a sharp decrease of the activity, and in the case of derivatives of 3-alkylpyrazolone they may show also a favorable influence. Some of the obtained compounds may be employed for preparing negative and contratype masking color motion-picture materials. It is shown that arylazo-derivatives of 3-alkyl- and 3-acetyl-n-pyrazolone usually absorb the light of the blue-violet range (maximum of absorption 400 - 420  $\mu\text{m}$ ). The entry of strong electron donor substitution agents into the phenylazo-group causes an appreciable deepening of their coloration. The absorption spectra of the masking pale blue components of the derivatives of 1,2-oxyphthalic acid include the blue-violet and partially the green portion of the spectrum and in many cases they consist of two bands whose relative intensity may change strongly according to the nature and position of the substitution agents in the arylazo-group. A particularly sharp increase of the absorption intensity in the blue-violet range takes place in the case of 2-methyl- and 2-chlorophenylazo derivatives. It is established that the majority of the investigated masking purple and pale blue components at pH 5 are, as a rule, stable enough in respect to solutions containing ferroyanic potassium. In alkaline bleaching solutions their stability strongly decreases.
