TITLE: On an approximate calculation of the Wiener integral 16

SOURCE: AN EstSSR. Izvestiya. Seriya fiziko-matematicheskikh i tekhnicheskikh nauk, no. 2, 1965, 214-222

TOPIC TAGS: integral equation, approximate calculation, integral function, functional equation, Taylor series

ABSTRACT: The author considers a numerical approximation of Wiener's integrals, denoted respectively by

$$\int_C F(x) d_W x, \int_{C^{(m)}} F(y) d_W y, \text{ and } \int_{C_{1,x}} F(x) d_{W(1,x)}^* x$$

and taken for functionals defined on the space  $C$  of all functions continuous on the segment  $[0,1]$ , in satisfying the condition  $x(0) = 0$ , and on which the Wiener measure is defined. The spaces

$$C^{(m)} = \left\{ y(t) \in C^{(m)}; y(t) = \frac{1}{(m-1)!} \int_0^t (t-u)^{m-1} x(u) du \right\}$$

Card 1/2

ACC NR: AP5028966

0

and

$$C_{1,X} = \{x(t) \in C_{1,X} : x(t) \in C, x(1) = X\}.$$

are also considered. The moments of the linear and quadratic functionals on these spaces are calculated and the results are used for the approximate calculation of the integrals of a functional of a special type (for example functionals  $F(\int_0^1 x(t) dt)$  and  $F(\int_0^1 x^2(t) dt)$ ) by integrating a segment of the Taylor series of the function  $F(u)$ . Although there exist exact formulas for the calculation of these integrals, their use entails great fundamental and technical difficulties, and this is the motivation for the derivation of the approximate equations. Orig. art. has: 16 formulas.

Title : The Morphology, Systematics and Phylogeny of the Supertribe Braconina Hal. (Hymenoptera, Braconidae)

Orig Pub : Zool. zh., 1957, 36, No 9, 1338-1354

Abstract : The investigation of the morphological structure of the palearctic species of the supertribe Braconina showed that the genera, which enter into its composition, may be divided into a number of groups, varying in accordance with the structure of the male genitalia, structure of the antennae and fibrous wings. Four new tribes and a new p. Pseudoglyptomorpha have been isolated. The phylogenetic significance of certain characteristics and

✓ 118. Uniform work of modern spindles. F. Tóbišch. Magyar Textiltechnika 1955, No. 9, pp. 343-346, 3 tabs.

With tape-driven spindles running on roller bearings the rpm and the number of twists per unit length are more even than with cord-driven spindles on plain bearings. For establishing numerical differences stroboscopic measurements were carried out on ring frames, twisting frames and mules. The evenness of the speeds measured on the different machines was compared by computing the root mean square deviations of speed by the percentual determination of the whole dispersion field and finally by investigating the percentage of spindles whose speeds deviated by 3, 5, 7%, etc. from the mean value. The advantages of modern types have been proved numerically. e. g. on ring frames the whole field of dispersion could be reduced from 51 to 14%. It was found that the type of bearings have a greater influence on results than the type of drive.

Methods of reducing the definite sugar loss in the extraction of sugar from the second run-off. N. J. Tsholevich. *Sovet. Sukkar* 1936, No. 1, 37-41; *Chem. Zentr.* 1937, I, 1040. — A discussion is given of the crystn. of the sugar from the 2nd run-off having a purity quotient of 68.5-71. The crystn. must take place under continuous agitation. The presence of well-developed crystals, formed during evapn., is necessary. With crystn. in agitators the supersatn. coeff. should be 1.16-1.35. W. A. M.

Protection of forearms and feet ought to be introduced. Treatment with dyes is considered as the simplest method in first aid as well as in further surgical treatment. Due to the application of this method in the period of one year few complications have occurred.

MED. PRACY 1957, 8/1 (57-62) Tables 2

Data concerning small burns are presented. Protection for feet and forearms must be used, especially on the most exposed posts. For first-aid as well as during the following surgical treatment, the use of dyes is probably the simplest method. This method of local treatment used for a period of one year gave the least complications.

Title : The study of the characteristics of the heat transfer process during boiling in pipes.

Orig Pub: V sb. gidrodinamika i teploobmen pri kipenii v kotlakh vysokogo davleniya. [In the symposium: Hydrodynamics and Heat Exchange in boiling in high-pressure boilers.] M., AN SSSR, 1955, 186-205.

Abstract: Results of research conducted in 1949 on installation No 4 at the Kiev branch of the Central Scientific and Research Institute of the Sugar Industry (TsINS) are presented. This research dealt with heat transfer during the boiling in pipes of water (at atmospheric pressure) and sugar solution (at pressures of 0.4-1 kg/cm<sup>2</sup> and concentrations of 35 to 70 percent), with natural circulation. The experimental apparatus is schematically

USSR/Fluid Mechanics. Heat Transfer

Abs Jour: Ref Zhur-Mekhanika, No 6, 1957, 6840

Abstract: On the basis of an analysis of the data obtained, it is stated that the relative quantities of the liquid and vapor phase for a given pipe are determined by the magnitude of the heat flow and the rate of circulation. Data are also presented on the intensity of heat transfer in the region of active boiling, which is divided into a zone with film-plug structure (up to  $\varphi \approx 70-80$  percent), where the heat transfer conditions are close to the conditions in a large volume of boiling fluid, and into a zone with an annular flow structure (for values of  $\varphi$  from 70-80 percent to 99 percent), where the maximum heat transfer intensity was obtained at a fully defined value of  $\varphi$ . It is pointed out that the optimum working conditions in a boiling-tube occurs when the coefficient of heat transfer, averaged along the pipe, reaches a maximum value. Limiting values at the end of the pipe (for boiling water--98-99 percent, and for sugar solutions--90-95 percent), which ensure optimum
