Title : New radio equipment

Periodical : Radio 10, 24-25, Oct 1954

Abstract : A brief description of new radio equipment is given. The following items are featured. A modernized "Minsk P-7-54" radiola (radio-phonograph); "Baku-51 radio receiver"; television indoor-antennas KTTA-I, ATKC-II-I, and ATKC-I; an indoor coil-antenna; a universal type pickup and a type "CH-320" voltage stabilizer. Illustrations.

TITLE: New Equipment (Novaya apparatura)

PERIODICAL: Radio, # 9, p 20 (USSR)

ABSTRACT: The "Zhiguli" and "Oktava" radio-record player combinations have identical circuit diagrams for VHF/FM, short (two bands), medium, and long wave reception. They are equipped with push-button switches, miniature tubes and optical tuning-indicators.

The power consumption does not exceed 70 w. Ordinary and long playing records can be played. The "Neva" radio-record player combination may be used for long and medium wave reception and for playing ordinary and long-play records. The receiving part contains the following tubes: "6A7" in the frequency-converter, "6K3" in the IF amplifier, "6H9C" in the LF detector and the preamplifier for radio reception and in the 2-stage amplifier for record playing, "6M6C" in the LF output amplifier and "6U5C" in the rectifier. Two "1ГД-5" loudspeakers are used. The dimensions are 415 x 325 x 315 mm and the weight is 13 kg. The power consumption is of 50 w for radio reception and 55 w for record playing.

Card 1/2

The "Neva" is an outdated design equipped with obsolete tubes and large-size constructional units. However, it is still

New Equipment

107-9-14/53

in production because of the great demand for radio-record player combinations and the absence of a better model.

The "Voronezh" receiver is built for long and medium waves. It is equipped with miniature battery tubes. It has a HF amplifier stage, a heterodyne-converter, an IF amplifier, a detector and two stages of LF amplification. A "1-ГД-6" type loudspeaker is used.

Two 90 volt batteries "54ACMЦГ-5-П" are used for the feeding of anode and grid circuits. The heating current is supplied by one 1.2 volt battery "1,28HBMЦ-525-П".

The plastic receiver cabinet weighs 4 kg and has the dimensions 270 x 210 x 160 mm. The effective sensitivity of the receiver is at least 400 microvolts.

TITLE: New Apparatus (Novaya apparatura).

PERIODICAL: Radio, 1957, #8, pp 21-22 (USSR)

ABSTRACT: The RIGA Radio Plant imeni A.S. Popov is preparing the production of the 12-tube superheterodyne radio "Festival" (Fig 1) with remote control.

In addition to miniature tubes, semi-conductors are also utilized in the rectifier, the frequency detector and the detector of the automatic tuning control.

The receiver contains LW, MW and four SW bands (from 24.5 to 51 m) and a VHF - FM band (4.11 - 4.65 m) is contained in a separate block.

A built-in dipole is utilized for VHF reception, a rotating interior magnetic antenna being used for LW and MW reception. The bands are switched by a key commutator.

Card 1/3 There are four electrodynamic loudspeakers: one 6-watt elliptic "6PA1-PP3" of 325x220 mm; one 1-watt "1PA1-PP3" having a

TITLE:

New Apparatus (Novaya apparatura).

107-8-29/62

diameter of 100 mm and two 4-watt "4ГA2-PP3" having a diameter of 200 mm. The sound frequency range is from 60 to 12,000 cps.

The remote control panel is in a plastic case of 228x120x58 mm.

The "VOLNA" superheterodyne receiver has LW and MW bands and contains 3 miniature tubes (two "6Н1П" and one "6П14П").

The "ДГ-44" replaces the signal and the automatic amplification control detector, the "ДГ-426" being used in the half-wave rectifier.

The fundamental characteristics of the "VOLNA" receiver are the same as those of "РЕКОРД", "МОСКВИЧ" and "АРЗ", but the range of sound reproduction is extended from 100 - 5,000 cps.

The reception of local radio stations is highly improved by the elimination of the reflex stage.

The "Zarya" TV set will replace the "KBH-49". It contains 12 tubes of the following types:

2 - "6H3П", 4 - "6Ф1П", 1 - "6П15П", 1 - "6П13С", 1 - "6Ц10П", 1 - "1Ц11П", 1 - "6П1П", 1 - "35ЛК2Б".

The video detector contains a germanium diode and the frequency

Card 2/3

TITLE:

New Apparatus (Novaya apparatura).

107-8-29/62

detector is transistorized. The rectifier also contains semi-conductors.

The power consumption does not exceed 100 watts.

This set is designed for five TV-channels and not for VHF-FM reception. It allows reception, without any accessory amplifier units, from a distance of 40-50 km.

SOURCE: Radio, no. 3, 1965, 36-38

TOPIC TAGS: circuit design, radio receiver, radio engineering, tape recorder, magnetic recorder

ABSTRACT: Radio-tape-recorder combinations are becoming very popular in the Soviet Union. Consequently, one of the factories of the Litovskiy sovmarkhoz developed and started producing the "Miniya" set which represents a modernized version of the "Vayva" radio-magnetic tape-recorder combination. It contains a five-tube first-class receiver (covering long waves, broadcasting band, short waves - 12.1-5.36 and 7.4-3.95 Mc, and the FM UHF band), four speakers, and a two-speed magnetic tape recorder "Vil'nyam" (19/05 and 9.53 cm/sec). The tape recorder can record radio programs, recorded music, or live material received through the MD-47 microphone. The article contains the circuit diagram and a general description of operation, but very few technical data. Orig. art. has: 2 figures. [JPRS]

AUTHORS: Torner, R. V. and Dobrolyubov, G. V. SOV/ 138-58-A-3/13  
TITLE: An Approximate Theory of the Mechanism of Rubber Milling  
(Priblizhennaya gidrodinamicheskaya teoriya mekhanizma  
val'tsevaniya)

PERIODICAL: Kauchuk i Rezina, 1958, Nr 4, pp 6-10 (USSR)

ABSTRACT: Theory of milling rubber has been based on the assumption that the material behaves as a plastic substance with definite limits of flow, analogous to metals. This leads to the conclusion that roll thrust force is a square function of the rotational velocity. This is in contradiction to experimental findings where the roll thrust forces are, in fact, proportional to the square root of angular velocity. The material does not exhibit Newtonian viscosity and account must be taken of the dependence of its rheological proportion on the velocity gradient of flow. The relationship between torque and rotational speed is non-linear. The authors develop equations, starting from the Harvey-Stokes equation, modified for an average viscosity coefficient dependent on an average velocity gradient. These equations give

Card 1/3 the instantaneous velocities  $V_x$  and  $V_y$  of the mass of

SOV/138 -58-4-3/13

An Approximate Theory of the Mechanism of Rubber

milled material at any point within the mass above and through the roll gap. (The material is assumed to adhere to roll surface in the region considered). Representative roll conditions are assumed and velocity profiles are drawn for several sections, the velocities being derived from these formulae. The maximum velocity of the material is 7 to 9 times the peripheral velocity of the rolls. Above the gap, the bulk of the material exhibits counterflow. Equations are developed, also for pressure on the rolls over the arc of contact, and a pressure profile is drawn, similarly, from these equations. From this, the shear forces opposing rotation can be calculated, and a figure obtained for total torque. The necessary rheological constants for construction of these velocity and pressure profiles were obtained by measurement of roll thrust forces on an actual set of rolls with a given rubber mix and inserting the actual values into the pressure equation to deduce these constants. These results show that the rheological constants are independent of roll gap and confirm the square root relationship of

Card 2/3

SOV/138-58-4-5/13

An Approximate Theory of the Mechanism of Rubber

spreading forces, to angular velocity of the rolls. Further confirmation of the velocity profiles was obtained by constructing open model sections of rolls, and using a two-coloured layered mix to indicate the flow of the material.

AUTHORS: Turner, R.V., Reznikovskiy, M.M.

TITLE: Meeting of the coordinating committee for instruments and methods of physico-mechanical tests

PERIODICAL: Kauchuk i rezina, no. 6, 1962, 59 - 60

TEXT: The meeting took place in February 1962. R.V. Turner spoke on methods of evaluating the technologies of raw rubber and non-vulcanized rubbers. He discussed: a) the condition of rapid control; b) determination of rheologic characteristics, necessary for the analysis of technological processes and for determining the equipment; c) state of the production check of rubber mixes in industrial rubber plants. It was recommended to use the more accurate shifting-type rotating instruments for rubber mix control. In 1959, НИИШП (NIISHP) ordered a viscosimeter. The BP-2 (VR-2) was manufactured in the "Metallist" Plant according to the design by Rezinoprojekt. Owing to its unsatisfactory functioning the following recommendations were made: a) in 1962, the NIISHP, in cooperation with the "Metallist" Plant, is to improve the design of the plastomer, for increasing accu-

Card 1/3

Meeting of the .....

racy and reliability of the instrument. By 1963, mass production of the VR-2, equipped with an attachment for registering the torsional moment should be possible; b) during the period 1962-1963, the "Metallist" Plant is to complete the instruments manufactured in 1959 with parts and attachments, as recommended by the NIIShP; c) the plants are to pledge start of production 6 months after receiving the additional parts. A seminary should be organized at NIIShP for exchanging experiences on the VR-2; d) the NIIShP, ВНИИСК (VNIISK), НИИПИ (NIIRP) and the НИИР (NIIR) are to be held responsible for the correct functioning of the VR-2 instrument. The meeting further recommended that: 1) the NIIShP, in cooperation with the НИИКИМП (NIIKIMP the Scientific Research Institute of Machine and Instrument Design), develop and test a model of express-plastomers in 1962, of the shifting type, with a time for the determination of plasticity duration, of not more than 1 minute, and test the possibility of determining the vulcanizability of the mix using the same model; 2) the NIIR should resume the study of determining the vulcanizability of mixes on the vulcameter; 3) suggest an experimental-industrial instrument for rapid-control, on the basis of tests performed on the two models prior to January 1963; 4) perform tests on industrial samples not later than August-September, 1963 and prepare suggestions for the organization of a series

Card 2/3

Meeting of the...

production of rapid-control instruments by 1964. Finally, the meeting suggested creating uniform methods for testing and building instruments. They recommended: 1) to make the NIIShP responsible for conducting tests on existing rotational and capillary viscosimeters, on uniform-model systems according to a unitary program, together with interested organizations; 2) to select the main design of the instrument from results of tests, and develop technological requirements in the design by 1963, with respect to the experimental-industrial viscosimeter, for use in determining the rheolic characteristics of raw and synthetic rubbers; 3) the NIIKIMP and the NIIShP are to ensure production and testing of the experimental-industrial viscosimeter and recommend a means for organizing the series production of the latter no later than by 1965.

Title : Determination of Amidochloride of Divalent Mercury with  
0.1 N Solution of Potassium Bromate.

Orig Pub : Acta pharmac. hung., 1957, 27, No 3, 97-101

Abstract : To 0.16-0.18 g NH HgCl are added 40 ml 0.1 N KBrO and  
1.5 g KBr. A vacuum is established in the flask and  
thereafter 10 ml 2 N HCl are added. As a result NH HgCl  
undergoes dissolution and from the KBr is liberated Br<sub>2</sub>  
which on addition of 2 N NaOH is converted to OBr<sup>-</sup>.  
The latter oxidizes NH which is formed according to the  
reaction:  $2\text{NH HgCl} + 2\text{NaOH} \rightarrow \text{HgO} + 2\text{NaCl} + \text{NH}_2$ , to free  
N<sub>2</sub>:  $2\text{NH} + 3\text{KOBr} \rightarrow 3\text{KBr} + 3\text{H}_2\text{O} + \text{N}_2$ . Excess OBr is de-  
termined iodometrically: 1.5 g KI are added, the mixture

is made acid with 2 N solution of HCl (20 ml), allowed to stand for 5 minutes, then 0.5 g NaHCO<sub>3</sub> are added and titration is carried out with 0.1 N solution of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. By subtracting the amount of consumed Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> from the amount of KBrO<sub>3</sub> used, the content of HgNH<sub>2</sub>Cl is determined. Determination error is from - 0.10% to 0.17%. The described method of determining NH<sub>2</sub>HgCl is more accurate than other known methods specified in the pharmacopoeias of different countries.

Budapest, Orvosi Hetilap, Vol 107, No 49, 4 Dec 66, pages 2332-2333.

Abstract: [Author's Hungarian summary] A case of simultaneous pregnancies is reported which was recognized previous to the surgery. On the basis of literature data, the pathogenesis, diagnostics and incidence of the disorder are discussed. Attention is called to the difficulties of an early diagnosis as well as to the complication which can arise in the absence of it. 15 Eastern European, 12 Western references.

TITLE:

Application of the Similarity Principle of the Inlet Effect  
on the Flow of Rubber Mixtures in Channels With Circular  
Cross Section

PERIODICAL:

Kolloidnyy zhurnal, 1960, Vol. 22, No. 5, pp. 625-630

TEXT: The present paper was read at the Subsection of Rheology of the  
Vsesoyuznyy s"yezd po teoreticheskoy i prikladnoy mekhanike (All-Union  
Conference on Theoretical and Applied Mechanics) on February 2, 1960. Es-  
sentially higher inlet effects than in Newtonian fluids occur on the  
flow of rubber mixtures in pipes with circular cross section. In this  
case, two kinds of pressure loss are observable during isothermal flow,  
i.e., losses in the region of steady flow, and pressure losses at the in-  
let caused by structure disturbance and highly elastic deformation when  
the rubber mixture enters the pipe. Two rubber mixtures of the types  
T-1 (T-1) (on the basis of CKH-26 (SKN-26) rubber) and T-2 (T-2) (on  
the basis of CKB-30-35 (SKB-30-35) rubber), whose composition is given,  
are mentioned. It was found that flow velocities from  $10^{-1}$  to  $10^2$  sec $^{-1}$

Application of the Similarity Principle of the Inlet Effect on the Flow of Rubber Mixtures in Channels With Circular Cross Section

and temperatures from 60° to 140°C the rheological characteristics of both mixtures can be represented by the equation  $\gamma = (\tau/c)^n$  (1) ( $\gamma$  = velocity gradient,  $\tau$  = shearing stress,  $n$  and  $c$  = empirical coefficients) (Table, values for  $n$  and  $c$ ). An equation is derived, which determines the relationship between the dimensionless parameters of flow and the dimensionless losses at the inlet. The author designates the latter as Euler number  $Eu_i$  of the inlet, which are determined by the effective Reynolds

number  $Re_r$  expressing the ratio between the inertial forces of flow and the forces of viscous friction on the walls of the pipe;

$Eu_i = 224 Re_r^{-0.935}$  (4). The experimental data obtained on determining

the pressure loss in pipes 4.0, 3.18, and 2.34 mm in diameter (Fig. 3) showed that in two pipes arranged one behind the other, the inlet losses in the pipe with the smaller diameter decreases in proportion to the energy consumed for structure destruction at the inlet of the pipe with the greater diameter, with  $Eu_{id}^i = Eu_{id} - Eu_{iD}(d^4/D^4)$  (6). ( $Eu_{id}^i$  and  $Eu_{iD} =$

Application of the Similarity Principle of  
the Inlet Effect on the Flow of Rubber  
Mixtures in Channels With Circular Cross  
Section

dimensionless inlet losses in the pipe with the smaller or the larger diameter, respectively;  $Eu_{id}$  = dimensionless inlet losses in the pipe with gradually diminishing diameter at the point of the smaller diameter). A comparison of the experimental values with those calculated from equation (4) shows the validity of the latter for the above-mentioned diameters. A method of calculating the flow of rubber and rubber mixtures in pipes with circular cross section is described. This method consists in a determination of  $Eu_1$  and  $Eu_L$  and a subsequent summation ( $Eu_L$  = dimensionless pressure losses for the region of steady flow (Refs. 6-9)). TITLE: Volumetric rate of flow in a flat convergent forced stream of incompressible fluid with anomalous viscosity

SOURCE: Mekhanika polimerov, no. 1, 1966, 116-122

TOPIC TAGS: fluid flow, fluid viscosity, incompressible fluid, forced flow, flow rate, rheologic property, rubber

ABSTRACT: The authors consider plane convergent flow of an incompressible fluid with anomalous viscosity whose rheological properties are described by a power law. A reduction in the useful cross section of the stream causes a back pressure which results in a counterflow at the input section in the region of the stream adjacent to a stationary wall. By analogy with plan-parallel flow of a fluid with anomalous viscosity, an equation is derived for calculating the volumetric rate of flow through a unit width of the flat confluent stream. Results of a test on the extrusion of a rubber compound on a natural rubber base with a conical-core extruder were in good agreement with theory. The experimental part of the work was carried out by R. Ya. Sutin.

AUTHOR: Torner, R.V.

TITLE: Transmission of hydrostatic pressure by non-vulcanized rubber along a cylindrical channel with flat diaphragms

PERIODICAL: Kauchuk i rezina, no. 2, 1961, 15 - 18

TEXT: The article deals with an investigation of the hydrostatic pressure distribution in a channel with diaphragms and being filled with a polymer. The apparatus used for the investigation is shown graphically in Figure 1 and is composed of the following parts: In the space of the joint of the assembled metal body a cylindrical channel having a diameter of 10 mm is placed. Channels are welded into the body for heating purposes, through which the heated liquid is passed. The latter is brought from an ordinary ultrathermostat. The lower end of the central channel is closed by a spiral-shaped cork. The temperature of the material in the channel of the mold is controlled by an unprotected needle-like thermocouple. Tensimetric pressure transmitters are placed along the axis of the channel at a distance of 15 mm from each other. Between each pair of transmitters a steel diaphragm is placed. During experiments the apparatus is placed on a ta-

Transmission of hydrostatic....

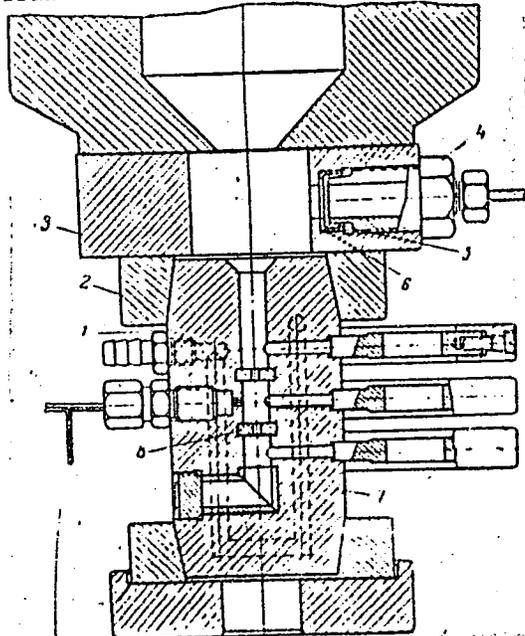

ble of a molding press. The rubber mixture enters the central channel of the chamber, passing along the path through ring 3 with a dynamometer 4. The showings of the manometer attached to the dynamometer serve as a check on the value and constancy of the pressure of the rubber mixture when entering the central channel. It was established experimentally that losses of the hydrostatic pressure occur when distributing pressure pulses along the channel containing local constrictions. The empirical formula is derived for estimating the value of the relative losses of the hydrostatic pressure. Table 1 lists the average values of the relative losses of pressure  $\Delta P/P_0$ , depending on the constriction coefficient of the channel  $d/D$  at various temperatures. The experimental results showed that the relationship between the value of the relative drop in the pressure  $\Delta P/P_0$  and the degree of throttling is described by the empirical formula:  $\frac{\Delta P}{P_0} = \alpha + \beta \frac{D}{d}$ .

The obtained data reveal that the value of the hydrostatic pressure loss can be determined not only experimentally, but also by mathematical calculations. In the latter case the values of the coefficients  $\alpha$  and  $\beta$  of the material from which the article will be formed must be determined experimentally. If these coefficients are known, the value of the hydrostatic pressure loss can be calculated for each of the local constrictions of the space in the press-mold, using the given equation. There are 3 figures, 2 tables and 4 Soviet references.

TEXT: The flow of non-vulcanized rubbers was experimentally studied on the basis of CKH 26<sup>u</sup>(SKN 26) and CKB 30-35<sup>u</sup>(SKB 30-35) rubbers (Table 1). The investigation was made in channels with circular cross section in the temperature range of 60-140°C. For determining the pressure along the channel the experimental arrangement shown in Fig. 1 was used. The experiments were made on a press constructed by Korpal'tsev which was provided with an additional temperature-regulating system. Thus, a constant temperature of the mixture was warranted with an accuracy of  $\pm 1 - 2^\circ\text{C}$ . Fig. 2 shows the typical form of the experimentally determined pressures along the channels. It was found that the pressure curve along the channel axis consisted of an inlet zone and a zone of stabilized

pressure. The presence of an inlet zone with a variable pressure gradient leads to extremely high inlet losses (Fig. 3). They attain 15-40% of the entire pressure gradient and are higher by  $10^8$  than the inlet losses of Newtonian fluids of similar viscosity. An analysis of the experimental data (Fig. 4) showed that the dimensionless inlet and pressure losses were mainly determined by the effective Reynolds number. Equations for determining the dimensionless inlet losses are suggested. Table 2 shows the experimentally obtained rheological characteristics of the mixtures investigated. There are 4 figures, 2 tables, and 21 references: 7 Soviet.

"Preparation of Acid Complex Rhenium Compounds by Reduction of Perrhenates  
With Hydrogen Under Pressure".  
Khimiya Redkikh Elementov, No. 1, pp 40-44, 1954.

Reduction of hydrochloric acid solutions of ammonium perrhenates with hydrogen under pressure results in the formation of acid complex compounds of Re (4+), Re (3+), and Re (2+) with the compositions  $(\text{NH}_4)_2\text{ReCl}_6$  (well-formed green octahedral crystals),  $(\text{NH}_4)_3\text{ReCl}_6$  (fine yellow crystals),  $\text{K}_2\text{ReCl}_6$  (blue-black needles),  $\text{K}_2\text{ReCl}_6$  (yellowish-green octahedral crystals), and  $\text{K}_3\text{ReCl}_6$  (fine yellow crystals).
