with aluminum oxide led to a decrease of shrinkage during sintering. The open porosity of castings saturated with aluminum chloride solution was considerably smaller after sintering than that of the ones not saturated. The results are given in Table 2. Repeated saturation with aluminum chloride of low-fired alumina

castings with aluminum chloride solution on the shrinking, change in porosity, and volumetric weight after a 6-hour sintering.

1. Addition; 2. number of saturations; 3. total shrinkage at  $^{\circ}\text{C}$ ; 4. porosity after sintering, %, at  $^{\circ}\text{C}$ , %; 5. volumetr. weight  $\text{g/cm}^3$  after sintering,  $^{\circ}\text{C}$ ;
6. none.

castings gave a considerable reduction of shrinkage after sintering. With the addition of magnesium oxide to alumina, the volumetric weight of castings after sintering at  $1500\text{ }^{\circ}\text{C}$  was very high. If there is need to produce corundum articles with high volumetric weight, saturation is unsuitable because it reduces the degree of porosity. Orig. art. has: 3 tables.

TITLE: Setting up reliability networks of neuron-like elements (25)

SOURCE: AN SSSR. Nauchnyy sovet po kompleksnoy probleme Kibernetika. Bionika (Bionics). Moscow, Izd-vo Nauka, 1985, 147-154

TOPIC TAGS: bionics, computer switching, logic element, logic circuit

ABSTRACT: The authors study neuron-like elements as logic elements which have n inputs and 1 output and realizing certain switching functions. Functional errors are discussed for a neuron-like element logic circuit. A system of inequalities is given for determining the function of a neuron-like element known as a threshold element in computer terminology. A method is presented for determining the required order of the circuit according to the given switching function and the required stability for a simultaneous change in parameters. The parameters of the coupling element depend on the circuit realization of the switching function. A redundancy circuit can be set up on the basis of threshold parameters having arbitrarily high stability with respect to simultaneous parameter changes. The threshold elements have

Card 1/2

L 34403-66

ACC NR: AT6009446

6

an arbitrarily low stability with respect to simultaneous parameter changes of the type discussed. This method is used for setting up redundancy circuits which execute both switching functions realized and not realized by a single threshold element. Orig. art. has: 2 figures and 25 formulas.

Working and Tool Making: R.D. Beyzel'man, Engineer.

PURPOSE: This book is intended for mechanics and designers engaged in modernizing  
machine tools.

COVERAGE: A brief description is given of modern universal drilling machines and  
machines of obsolete design which predominate in the operating stock. Their  
utilization is analyzed and on the basis of the analysis, the basic require-  
ments for modernizing this type of machine tools are developed. Recommen-  
dations and concrete design solutions concerning increase of speed, feed power,

Card 1/4

Modernization of Universal (Cont.)

SOV/1688

rigidity, vibration-stability, and life of drilling machines in the operating stock are presented. Special attention is given to problems of reducing auxiliary time. Equipping universal drilling machines with various attachments and auxiliary devices in order to widen their applicability is also described. No personalities are mentioned. There are 42 references of which 38 are Soviet, 3 English, and 1 German.

TOTENKY, I. A.21(6) SPP/2001

International Conference on the Peaceful Uses of Atomic Energy, 2nd, Geneva, 1955  
 Soviet research (nuclear) problems. USSR Commissariat of Soviet Scientists,  
 8,000 copies printed.

Mr. (Title page), A.I. Al'tshuler, Academician V.F. Veksler, Academician and  
 Professor A.S. Ginzburg and Dr. S.Y. Sosulin, Candidates of Physical and Mathematical  
 Sciences, etc. (Chinese book); Dr. Shchepetov, Secy. Min. Sci., Tech. Sci. [22].

Some collections of articles intended for scientific research workers  
 or other persons interested in nuclear physics. The volume contains 43 papers  
 selected by Soviet scientists in nuclear physics. The volume contains 43 papers  
 presented at the Second Conference on Peaceful Uses of

nuclear energy. Part I contains 17 papers dealing with  
 nuclear physics and concerned with molecular reactions, and Part II contains  
 26 papers on nuclear physics. Problems of particle acceleration and  
 related work on nuclear reactors. The review paper by L.D. Artsimovich presents a review of  
 work on nuclear reactors. The remaining papers is  
 deal with particular problems in this field.

Paper in Part II dealt in detail with nuclear problems in nuclear physics,  
 as the creation of heavy atomic nuclei and the study of  
 the radiation produced by such particles and nuclei, described  
 by N. N. Basov. The American-language articles of the proceedings of  
 conference is published in 16 volumes. The first 6 volumes contain all the  
 papers presented by Soviet scientists at volumes Volume (1), "Radiative  
 (Nuclear Physics)", Volume (2), "Radiative instability and  
 nuclear reactor fuel and reactor power"; Volume (3), "Radiative instability and  
 astrophysics"; Volume (4), "Radiative instability and radiation trans-  
 portation"; Volume 5, "Radiative instability and radiation (Radioactive  
 and Radiation Medicine)", Volume (6) "Radiative instability and  
 reaction and ionization". The other 10 volumes contain selected papers  
 presented at the Conference by scientists from other countries. In the present volume  
 there are some articles from the English language edition of the proceedings  
 of the conference. The English edition of the conference is also identical  
 to the Russian edition. The serial number of report 250 and 250 are reported in  
 the English edition. Report 251, by Shchepetov, etc. is 250 and 250 in the  
 English edition.

TITLE: Dispersion of medium-energy nucleons and the optical nuclear model  
SOURCE: Tashkentskaya konferentsiya po mirnomy ispol'zovaniyu atomnoy energii. Tashkent, 1959. Trudy. v. 1. Tashkent, 1961, 10<sup>3</sup> - 10<sup>6</sup>

TEXT: The authors studied the angular distributions of elastically scattered 6.8-Mev protons and 2.8-Mev neutrons. The protons were obtained from the cyclotron of the Institut fiziki AN USSR (Institute of Physics AS UkrSSR). The scattered protons were recorded with a scintillation spectrometer consisting of a CsI(Tl) crystal, an ФЭУ-29 (FEU-29) photomultiplier and an electronic recorder. Due to the energetic resolution of the instrument (3.5 - 4%) the group of elastically scattered protons can be separated from that of the inelastically scattered protons. The angular distribution of elastically scattered protons was measured between 20 and 160°. Bi, Pb, Sn, Cd, Ag, Zn, Cu, Ni, Co, Fe, or Al were used as targets. Nuclei whose Coulomb barrier allowed the incident protons to

Dispersion of medium-energy nucleons ...

enter the range of action of the nuclear forces showed deviations of the experimental cross section from the Rutherford cross section (Fig. 1). The reaction D(d,n)He<sup>3</sup> served as neutron source (bombardment of heavy ice by 130-kev deuterons). The scattered neutrons were measured in an 11-atm methane chamber with collecting electrode (25 - 105°). It was found that the angular distributions of elastically scattered neutrons strongly differ also for elements with approximately equal atomic weight. A variant of the optical model with diffuse surface is suggested, with a potential  $V(r) = \{1 + \exp[(r-R)/a]\}(V + iW)$ , where V, W, R, a are the model parameters according to R. D. Woods, D. S. Saxon (Phys. Rev., 95, 577, 1954). The results of calculations on the basis of this model were in good agreement with the experimental data (Fig. 3). Experiments on proton scattering from separated isotopes (Ni<sup>58</sup>, Ni<sup>60</sup>, Ni<sup>62</sup>, Cr<sup>52</sup>, Cr<sup>53</sup>) made together with A. P. Klyucharevskiy and I. V. Zalyubovskiy also gave different angular distributions which are explained by the shell structure of the nucleus. To gather experimental material further experiments of this kind are being conducted in the authors' laboratory. There are 3 figures and 11 references: 4 Soviet and 7 non-Soviet. The four references to English-language publications read as follows: Bromly, D. A., Card 2/A<sub>3</sub>

AUTHORS: Pasechnik, M. B., Pucherov, N. N., Totskiy, I. A., Chirko, V. I.

TITLE: Scattering of medium-energy nucleons, and the optical model of the nucleus

PERIODICAL: Referativnyy zhurnal, Fizika, no. 12, 1961, 111, abstract 12B580  
("Tr. Tashkentsk. konferentsii po mirn. ispol'zovaniyu atomn. energii", 1959, v. 1, Tashkent, AN UzSSR, 1961, 103-107)TEXT: There were investigated the angular distributions of 6.8-Mev protons and 2.8-Mev neutrons elastically scattered by nuclei of Bi, Pb, Sn, Cd, Ag, Zn, Cu, Ni, Co, Fe and Al and nuclei of Bi, Pb, Hg, Sb, Sn, Cd, Zn, Cu and Fe respectively. For medium-weight nuclei the angular distributions of elastically scattered protons represented in the form  $\delta(\theta)/\delta_R(\theta)$  reveal a diffraction structure which becomes disturbed on going to the lighter nuclei. The experimental angular distributions of elastic scattering were compared with calculations carried out according to the optical model of the nucleus. The distributions of neutrons scattered by Fe, Sn and Bi are not only in qualitative but also in quantitative agreement with calculations based on the blurred-edge

TOPIC TAGS: neutron scattering, thermal neutron, elastic scattering, inelastic scattering, nuclear scattering, nuclear shell model, optic model

ABSTRACT: This paper is a brief review of research on scattering of neutrons in the intermediate energy range using the electrostatic generator at the Institute of Physics AN UkrSSR. Data are given on inelastic scattering of neutrons with energies of 0.8, 2.5, 3.3, 3.6 and 4.1 Mev by nuclei of the following elements: C, Na, Mg, Al, P, S, Cl, Ca, Cr, Fe, Co, Ni, Cu, Zn, Se, Zr, Mo, Ag, Cd, Sn, Sb, Te, I, Ba, W, Hg, Pb, Bi and U. The resultant data were used for establishing the effect of nuclear shells in inelastic scattering of neutrons. The angular distribution of elastically scattered neutrons with energies of 0.3, 0.5, 0.65 and 0.8 Mev by the nuclei

TITLE: Measurement of angular distribution of neutrons with energies of 0.3, 0.5,  
and 0.8 Mev in elastic scattering on titanium and cobalt nuclei

SOURCE: Ukrayins'kyy fizichnyy zhurnal, v. 11, no. 5, 1966, 563-565

TOPIC TAGS: angular distribution, elastic scattering, neutron scattering,  
scattering cross section, titanium, cobalt, nuclear energy level, nuclous

ABSTRACT: These measurements were carried out because the available data on angular  
distribution in elastic scattering of neutrons with energies of less than 1 Mev are  
inadequate for calculating the mean nuclear physical constants with sufficient  
accuracy. The measurement results are given in the accompanying table from which  
it is seen that the data on the total cross section obtained by calculation are in  
good agreement with the experimental data (column 3) obtained by D. Hughes and  
J. Harvey (Neutron Cross Section, Second Edition, BNL-325, 1958). Orig. art. has:  
2 formulas, 2 figures, and 1 table.

ABSTRACT: A dilatometer is described for the measurement of the thermal expansion of solids by the Henning method at temperatures from -194 to 1100C. Specimens of the steels 1Kh18N9T, EI-572, EI-783, EI-606, EI-802, 15KhM, EI-607, EI-929, EI-617, and of molybdenum, tungsten, and nickel were tested. Many of the results were compared with data by others. The error in the measurement of the coefficient of linear expansion does not exceed 1%. The discrepancy with data

ACCESSION NR: AP4038436

by others does not exceed in most cases 2.5%. The causes of some discrepancies are discussed. "The author is sincerely grateful to D. L. Timrot for help with the work." Orig. art. has: 8 tables, 5 figures, and 2 formulas.

AUTHOR: Timrot, D. L.; Totskiy, Ye. Ye.

TITLE: Dilatometric method for experimental determination of the thermal conductivity of aggressive gases and vapors at high temperatures

SOURCE: Teplosizika vysokikh temperatur, v. 3, no. 5, 1965, 740-746

TOPIC TAGS: heat conductivity, gas corrosion, thermal expansion, alkali metal

ABSTRACT: A new dilatometric method has been worked out for studying the thermal conductivity of the vapors of the alkali metals. Its distinguishing characteristics are that the material under investigation comes into contact only with materials which are resistant to it and there is no need for electric insulating materials. The method has two main features: measurement of the temperature difference in the gas layer by thermal expansion of the walls enclosing the layer; and experimental elimination of end effects by varying the depth of insertion of the heater. In the experimental apparatus, two coaxial cylinders form an annular space filled with the material under investigation. The upper ends of the cylinders

ders are welded together, while the lower ends are joined by a thin walled bellows and can be displaced one relative to the other by thermal expansion. The unit is placed inside a furnace in which the experimental temperature is maintained. A long heater, whose depth of insertion can be adjusted, is located inside the experimental tubes. The difference in the expansion of the tubes is measured by a length meter at the bottom of the tubes; from this difference the thermal conductivity of the gas between the cylinders is computed. The article gives a sample calculation, based on experimental data on the thermal conductivity of helium in the temperature interval from 442 to 1015 C, at atmospheric pressure. The temperature difference in the experiments was of the order of 10-30C. The portion of the heat flux transferred by radiation reached 16% at high temperatures. The authors' data are compared with data from the literature, with good agreement. It is claimed that in the investigation of gases with a thermal conductivity of from 0.01 to 0.05 kcal/m-hour-degree, the error of the method reaches 15-20%, the largest part of which is due to error in the introduction of a correction for radiation. The temperature difference itself can be measured with an error of 3-4%. Orig. art. has: 11 formulas and 4 figures

TITLE: Experimental investigation of the viscosity and thermal conductivity of sodium and potassium vapors

21

SOURCE: Teplofizika vysokikh temperatur, v. 4, no. 1, 1966, 141-142

TOPIC TAGS: sodium, potassium, vapor, heat conductivity, viscosity

ABSTRACT: The NII of High Temperatures (NII vysokikh temperatur) during the period of 1960—1964 performed experimental investigations of the viscosity and heat conductivity of sodium and potassium vapors. The results of the measurements and extrapolation of viscosity were discussed in detail earlier (D. I. Timrot, B. I. Stefanov. Nauchnyy otchet NII vysokikh temperatur, 1962). An experimental investigation of heat conductivity was performed by the dilatometric method, developed by the present authors, and described elsewhere. In accordance with this method, the temperature difference between two coaxial cylindrical surfaces is measured according to the difference of the thermal expansion of the cylinders. Measurements of the degree of blackness are performed on the same apparatus in the intervals between the series of heat conductivity measurements. The error for radiation reaches 35—70% of the total heat flux in tests with sodium and 50—80% with potassium. The maximum relative error

amounts to 20% on the average. The experiments showed a substantial dependence of heat conductivity of the vapors of sodium and potassium on pressure. The results of the investigation are tabulated. A detailed description of the design of the experimental apparatus, data processing methods, results, and a comparison of the results with available data in the literature will be published. Orig. art. has: 3 tables.
