AUTHOR: Trofimov, A. S.

TITLE: Thermal stresses in blocks of rectangular cross section with heat production

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, v. 6, no. 2, 1963, 127-130

TEXT: Knowing the heat separation q_v and the temperature field $T(x,y)$, for example in a nuclear reactor part of rectangular or nearly rectangular cross-section of area $2a$ by $2b$ ($l > 3a$, $a < b$), one can determine the thermal stresses in it. This problem is here approached for zero axial temperature gradient (plane deformation). The axial stress on a free rectangular prism is then

$$\sigma_z = \alpha E \left[\frac{1}{4ab} \int_{-a}^a \int_{-b}^b T dx dy - T(x,y) \right] + (\sigma_x + \sigma_y) \quad (1).$$

The stress functions

$$\sigma_x = \frac{\partial^2 \Phi}{\partial y^2}; \quad \sigma_y = \frac{\partial^2 \Phi}{\partial x^2}; \quad \tau_{xy} = -\frac{\partial^2 \Phi}{\partial x \partial y} \quad (2)$$

Card 1/3

Thermal stresses in blocks of ...
are determined by the equation

S/170/63/006/002/017/018
B108/B186

$$\nabla^4 \phi + \frac{\alpha E}{1-\nu} \nabla^2 T = 0,$$

$$\nabla^4 = \frac{\partial^4}{\partial x^4} + 2 \frac{\partial^4}{\partial x^2 \partial y^2} + \frac{\partial^4}{\partial y^4}; \quad (3),$$

$$\nabla^2 = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2},$$

with the boundary conditions at the outer surface $\phi = \frac{\partial \phi}{\partial n} = 0$. In a steady process $\nabla^2 T = -q_v/\lambda$, which for $q_v = \text{const}$ gives for the dimensionless stress function $u = \phi \lambda (1-\nu)/\alpha E b^4 q_v$ the problem:

$$\nabla^4 u = 1 \quad \begin{matrix} -c < x < c, \\ -1 < y < 1, \end{matrix}$$

$$x = \pm c = \pm \frac{a}{b} \quad u = \frac{\partial u}{\partial x} = 0, \quad (4)$$

$$y = \pm 1 \quad u = \frac{\partial u}{\partial y} = 0$$

Card 2/3

Thermal stresses in blocks of ...

S/170/63/006/002/017/018
B108/B186

This is solved by variation with the n-th approximation of $u(x,y)$ assumed in the form $u_n = (x^2 - c^2)^2 (y^2 - 1)^2 (a_1 + a_2 x^2 + a_3 y^2 + \dots)$. The coefficients a_k are given by the equation

$$\int_{-c}^c dx \int_{-1}^1 \left[\nabla^4 \sum_{k=1}^n a_k \varphi_k - 1 \right] \varphi_s dy = 0, \quad s=1, 2, \dots, n, \quad (6)$$

$\varphi_1 = (x^2 - c^2)^2 (y^2 - 1)^2$; $\varphi_2 = \varphi_1 x^2$; $\varphi_3 = \varphi_1 y^2$
These coefficients were numerically calculated up to the third term. There are 1 figure and 2 tables.

TITLE: The optimum control of thermal processes in nuclear reactors 19

SOURCE: Atomnaya energiya, v. 19, no. 6, 1965, 537-540

TOPIC TAGS: nuclear reactor operation, nuclear reactor ~~characteristic~~, nuclear reactor control, *optimal control*

ABSTRACT: The authors studied earlier (Zh. vychisl. matematiki i matem. fiziki, 5, 558, 1965) the optimum response control of transient thermal processes in nuclear reactors. The control was carried out by changing the flow of the coolant $G(\gamma)$. The present note is a continuation of the investigation of the dynamic properties of the thermal model of nuclear reactors serving as a component of the control system. The influence of heat exchangers, circulation pumps and other components on the transient processes in the reactor is not taken into account. For a given linear law of reactor power change $q(\gamma)$ a determination is made of $G(\gamma)$ to assure, during the transient process, the minimum deviation from the linear temperature variation at the output. The same problem is also considered for arbitrary $q(\gamma)$. The results are given as curves of optimum reactor power increase and decrease for different reactor parameters. Two separate families of curves correspond to the minimum transient

TITLE: Attack in the cosmos

SOURCE: Aviatsiya i kosmonavtika, no. 4, 1963, 6

TOPIC TAGS: antisatellite defense, detection satellite, space warfare, reconnaissance satellite

ABSTRACT: The author examines the problem of determining the task of the enemies satellites shortly after they are placed in orbit -- are they for reconnaissance, do they carry an atomic bomb or are they for peaceful purposes. This is important for the defense of the country. Since it is not possible to do this from the earth with present equipment, an observation satellite is needed. This satellite would have a television camera and Geiger counter installed in it and could be moved from one orbit to another on command from earth. When an enemy satellite is placed in orbit the observation satellite would be moved into the same orbit and would send back television pictures to a command center. If,

Card 1/2

L 18797-63

ACCESSION NR: AP3006055

after viewing the satellite and getting the radioactive count, it was determined that its task was a danger to the national security the order would be given to destroy it. The observation satellite would be moved into another orbit and a manned satellite would be sent into orbit to carry out the destruction.

Periodical : Priroda 44/3, 115 - 116, Mar 1955

Abstract : The transition from sea vertebrates to land vertebrates during the Devonian period is discussed in the light of recent paleontological finds, particularly those made by Danish scientists in Greenland. These finds were included in a collection of 170 specimens, which were studied and the conclusions published in 1952 by the Danish paleontologist Erik Jarvik. Two Danish references, (1932 - 1952). AUTHOR: Trofimov, B. Ye.

TITLE: Quantization noises in coding signals of uniform spectral density

PERIODICAL: Elektrosvyaz', no. 7, 1960, 3-12

TEXT: The author carries out an analysis of the spectral distribution of mean-power quantization noises in pulse-code modulation of signals. The analysis revealed that the mean power of the quantization noises in the frequency band $0 \div \frac{\Omega_s}{2}$ is equal to $\frac{\delta^2}{12}$; where Ω_s - sampling frequency; and δ - quantum step. The power distribution of quantization noises within the frequency limits from 0 to $\frac{\Omega_s}{2}$ is practically uniform if $(\frac{\sigma}{\delta} \frac{\Delta\omega}{\Omega_s}) > \frac{0.3}{\mu}$; where σ - root-mean-square value of the normal stationary random process; $\Delta\omega$ - frequency band; and μ - a parameter defining the signal position in the band of the communication system. The distribution of noises is uniform regardless of the frequency when $\frac{\sigma}{\delta} \frac{\Delta\omega}{\Omega_s} > 0.15$. When $\frac{\sigma}{\delta} \frac{\Delta\omega}{\Omega_s} < 0.15$, the distribution of

mean-power quantization noises is nonuniform and the noise level in the signal frequency band nonmonotonously depends on the signal position in the band of the communication system. The fluctuations of the noise level in the $\Delta\omega$ band increase substantially as the value of $\frac{\sigma}{\Omega_s} \Delta\omega$ is decreasing. The signal-to-noise ratio in the signal frequency band is monotonously increasing with the increase of its strength. At small $\frac{\sigma}{\Omega_s}$, the distribution of quantization noises in the band of the communication system is irregular and the signal-to-noise ratio is proportional to σ^3 . At larger $\frac{\sigma}{\Omega_s}$, the signal-to-noise ratio is increasing proportionally to σ^2 . The signal-to-noise ratio decreases monotonously in the signal frequency band with the increase of the signal frequency bandwidth $\Delta\omega$. An increase of the sampling frequency leads to the increase of the signal-to-noise ratio in the signal frequency band. The relation $\left(\frac{\sigma^2}{P_{1 \cdot i}}\right) = f(\Omega_s)$, shown in Figure 5, is determined by the mean value of the signal frequency ω_i . If $\frac{\omega_i}{\Delta\omega} < 1.7 \frac{\sigma}{\Omega_s}$, then at small $\frac{\Omega_s}{\Delta\omega}$ values the

Quantization noises in coding signals of...

signal-to-noise ratio increases in proportion to Ω_s . At $\frac{\omega_1}{\Delta\omega} \gg 1.7\frac{c}{\delta}$, an increase of $(\frac{\sigma^2}{P_{1=1}})$ takes place nonmonotonously with the increase of Ω_s . In both cases, the noise level in the signal frequency band remains invariable starting from a certain Ω_s value and is equal to the noise level in this frequency band at amplitude quantization. Formulae and numerical examples for calculating quantization noises are given. There are 4 figures and 4 references: 3 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: Bennet, "Spectra of Quantized Signals" BSTJ, no. 3, 1948.

TITLE: A method for purifying polycapronamide. Class 39, No. 176680 ¹⁵

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 23, 1965, 47

TOPIC TAGS: oligomer, polymer, vacuum refining, polyamide compound

ABSTRACT: This Author Certificate presents a method for purifying polycapronamide from low molecular impurities by means of a vacuum distillation. To improve the technological process, the cyclic oligomers of ϵ -aminocaproic acid, which are present in the impurities, are decomposed catalytically at a temperature of 250--260C.

TITLE: Welding Plastics With High Frequency Current (Svarka plasticheskikh mass tokami vysokoy chastoty)

PERIODICAL: Svarochnoye proizvodstvo, 1958, Nr 9, pp 9-11 (USSR)

ABSTRACT: Information is presented on new, special equipment used for welding thermoplastics with high frequency current. The following devices and their operation are described: "LGS-02" machine (fig. 1) and "MST-3M" machine (fig. 3) for roller welding; "LGSP-0.4" press (fig. 4) for press welding. Characteristics of the machines are given in table 1. Information includes description of methods for checking the tightness of seams and of the base material by: 1) electric spark method on a special device shown in fig. 6; 2) use of a 2% aqueous solution of fuchsin; 3) electrolytic method. There are 2 tables, 3 diagrams, 1 circuit diagram and 3 photos.
