TITLE: An oceanographic vessel built in Poland

SOURCE: Mlody technik, no. 11, 1966, 36-41

TOPIC TAGS: oceanographic ship, marine engineering, shipbuilding engineering

ABSTRACT: The design of the oceanographic vessel type "850" by the Central Ships Construction Bureau Gdansk (Centralny Biuro Konstrukcji Okretow) and its construction by the A. Warski Wharf, Szczecin (Stocznia Szczecinska im. A. Warskiego) are reviewed. The ship, 89.7 m long and 13 m wide, has been sold to the Soviet Union and sails under Soviet flag as "Nikolai Zubov." Individual features include a special reinforced hull and anchoring devices for polar conditions and ice, high stability, a 4800-km power plant, 14 and 17 nautical miles regular and maximum velocity, respectively, a range of 13,500 nautical miles, laboratories, living and working units for a 108-man crew, and special equipment for oceanographic work. A second type "850" vessel is presently designed for meteorologic work.

Title : Study of Double Refraction of Thermally Strengthened Polycaprolactam Fibers.

Orig Pub: Przem. włókienniczy, 1957, 11, No 3, 115-117.

Abstract: The double refraction (DR) of polycaprolactam fibers (PCLF) was studied with a polarimeter microscope and monochromatic light ($\lambda_{\text{max}} = 556 \text{ m}\mu$). DR was computed by the equation $\gamma = n \cdot \lambda / 1000d$ (1), where n is the number of interference lines, λ is the wave length of the monochromatic light in $\text{m}\mu$, and d is the fiber thickness in μ (fibers 260 to 350 μ thick)

were used). The number of interference lines was determined according to E.F. Gurnee by the "fiber-wedge" method (Gurnee E.F., Praca zbiorowa - "Len, konopie, wewna". Poznan, 1947). The method does not need any complicated equipment and makes it possible to determine the magnitude of the DR change in the fiber mass. It was found that the DR of polycaprolactam fibers depends on the manner, in which the thermal strengthening of fibers has been carried out. The author arrives at the conclusion about the optical homogeneity of studied PCLP-s.

TITLE: The structure of polyacrylonitrile fibers

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 6, 1962, 703, abstract
6P650 (Przegl. włókienn., v. 15, no. 5, 1961, 216 - 218)

TEXT: On the basis of a critical review of the possible crystalline structure of polyacrylonitrile and in the light of X-ray studies the following constants are suggested for the paracrystalline hexagonal polyacrylonitrile cell: $a = 6.0 \text{ \AA}$, $b = 6.0 \text{ \AA}$, $c = 6.8 \text{ \AA}$, $\gamma = 120^\circ$. These values yield a lattice density of 1.20 g/cm^3 ; the experimental value for the density of polyacrylonitrile fibers was 1.14 g/cm^3 . [Abstracter's note: Complete translation.]

TOPIC TAGS: rnase activity, leukemia, disease control, serology, enzymology, enzyme, blood disease, ribonuclease

ABSTRACT: Studies have been undertaken to elucidate the increased RNase activity in the urine of chronic granulocytic leukemia (cgl) patients. Included in the studies are 1) preliminary characterization of the factors responsible for serum and urinary nucleolytic activity; 2) search for interdependence between urinary and serum RNase activity and leukocytosis; 3) correlation between urinary and serum activity; 4) attempt to estimate the importance of the kidneys in disorders of RNase activity in leukemias on the bases of renal-function studies. Thirty-five clinical patients with cgl participated in the experiment; for

1/3

in range of leukocytosis from 10,000—300,000. Experiments indicate that there is a state of equilibrium between RNase activity and level of leukocytosis in cgl. As a result, high levels of leukocytosis are accompanied by high RNase activity. The occasional drop in the leukocyte level is explained by a negative feedback relationship. This hypothesis supports the view that leukocytes are a source of serum RNase. The authors express their indebtedness to Miss Olga Sobejko for technical assistance.

TITLE: Disorders of ribonuclease activity in chronic granulocytic leukemia

SOURCE: Acta medica polona, v. 7, no. 3, 1966, 299-309

TOPIC TAGS: rnase activity, leukemia, disease control, serology, enzymology, enzyme, ~~blood disease, ribonuclease~~

ABSTRACT: Studies have been undertaken to elucidate the increased RNase activity in the urine of chronic granulocytic leukemia (cgl) patients. Included in the studies are 1) preliminary characterization of the factors responsible for serum and urinary nucleolytic activity; 2) search for interdependence between urinary and serum RNase activity and leukocytosis; 3) correlation between urinary and serum activity; 4) attempt to estimate the importance of the kidneys in disorders of RNase activity in leukemias on the bases of renal-function studies. Thirty-five clinical patients with cgl participated in the experiment; for

Card 1/3

ACC NR: AP6031249

comparison, there were 20 patients with lymphatic leukemia (11) and 20 patients with myeloblastic leukemia (ml). The control consisted of 150 healthy people. The serum and urinary activity was determined by the orcinol method, and later by the spectrophotometric method. AcPase activity was determined by the Bessey method; creatine and serum nonprotein nitrogen were assayed by the methods of Jeffrey and Rappaport, respectively. The results were 1) Agreement of nucleolytic activity of serum and urine with well-known properties of ribonuclease was shown. 2) Serum RNase activity was markedly elevated both in the serum and in the urine of the patients. 3) AcPase activity was comparable in both groups. 4) There was a marked correlation between levels of serum and urinary RNase activity in the patients. In cgl, less pronounced correlation indicated disorders in the excretion of RNase. 5) RNase clearance values in cgl were shown to be neither dependent upon serum RNase activity nor related to the levels of leukocytosis. 6) A distinct correlation between leukocytes and RNase activity, described by the following formula, was shown:
where Y is the serum RNase activity in $\mu\text{g}/\text{ml}$ and X is cgl leukocyte count in thousands. Maximal RNase activity occurred in range of low leukocytosis (around 3000) and highest leukocytosis (100,—300,000). Lowest values of RNase occurred

Card 2/3

AUTHORS: Tutak, Marian, Docent, Engineer; Urbańczyk, Leon, Engineer

TITLE: Machine-Tool Industry of the Poznań District - Machine Tool Production of the H. Cegielski Plant

PERIODICAL: Przegląd Mechaniczny, 1960, No. 19 - 20, pp. 585 - 589

TEXT: The Poznań district, especially Poznań City, is one of the most important centers of the Polish machine-tool industry. Among the large machine-tool plants in Poznań the authors list: the Zakłady Przemysłu Metalowego H. Cegielski (Metal Industry Plant H. Cegielski), the Wielkopolska Fabryka Urządzeń Mechanicznych Wiepofama (Wielkopolska Mechanical Equipment Plant Wiepofama), the Fabryka Obrabiarek (Lathe Plant) in Pleszew, the Fabryka Obrabiarek in Jarocin, the Poznańska Fabryka Maszyn i Urządzeń (Machine and Equipment Plant) in Poznań, and the Żnińska Fabryka Maszyn (Żniń Machine Plant) in Żniń. Further, the authors outline the production history of the H. Cegielski plant, covering the periods 1937 - 1939 and 1945 - 1959. From 1946 to 1959, the H. Cegielski plant produced 45 types of machine-tools and 6 types of presses, 5 of which were produced by the Fabryka Parowców (Locomotive Plant). By the end of 1959, the H. Cegielski plant had produced

Machine-Tool Industry of the Poznań District - Machine Tool Production of the H.
Cegielski Plant

10,199 machine-tools and 294 presses. The plant produces: wall-type drilling machine Ws 2.5; radial drill with table Type Wr_s 25/0.8; radial drill Types Wr 50/1.6 and 50/2; Wr 80/2.5 and Wr 80/3.2; radial bed drilling machines Types Wr_l 50/2, Wr 80/2.5 and Wr_l 80/3.2. The symbols indicate: first number - maximum drilling diameter in steel and the second number - maximum spindle radius. Capstan lathes are the basic product of this plant, and until 1959 about 41% of the total production consisted of these lathes. Up to now, the following types were produced: RH16, RH25, Rhr25, Rh32, Rv32, Rv40, RVA, Rva50, Rva63, Rvl63, Rv80, and RVP100. The symbols indicate - "H" or "h" horizontal and the letter "v" or "v" vertical axis of the capstan headstock. The number indicates the biggest rod diameter. The RH16 and RH25 capstan lathes are the most modern in their class having multi-phase motors. Capstan lathes Type Rh32 and Rv32 were produced since 1949, the latter was replaced by the Rv40 in 1950. Production of the Rhr25 lathe and the RVA type lathe with 4 and 6 openings in the headstock was also stopped in 1950. After the production of light lathes was mastered, production of heavy lathes type Rv80 and Rv50 was taken up. Both types were hydraulically program-controlled, while the Rva50 and Rva63 have mechanical pre-selectors. The need of lighter and simple lathes caused the

Machine-Tool Industry of the Poznań District - Machine Tool Production of the H.
Cegielski Plant

RVL63 capstan lathe to be designed, which replaced the capstan lathe Types Rv50, Rva50 and Rva63. For heavy-duty machining the RVP100 capstan lathe was designed. After 1965, in addition to the RH16, RH25 and RVL63, the following capstan lathes will be produced: the RVA40, the RVA63 and the RVA100. The production of single-spindle turning lathes began in 1954, and after a short time the AJ25 turning lathe was substituted with the ATL40 type, which was based on a Czech lathe produced by Skoda. On the last Poznań Fair, a new type of turning lathe, the ATA20, was exhibited. This new type is similar to the ATL40 lathe, with same operating principles, but a number of modern solutions. According to plans the production of this type of lathes will be increased. The first milling machines Type Ful were produced in 1947, and later were replaced by the Fula, the production of which was stopped. Radial saws Type Cr71 were first produced in 1947, and in 1957 a new type, the CRA 710, was designed. This type has a dosing pump which regulates the feed, while the Cr71 was equipped with a throttle. In addition, the feed bed was reinforced and the hydraulic feed drive engine was replaced with an electric motor equipped with a control. The growing trend of automating production processes resulted in the design of a new model of the CRA 710 radial saw, the CRB 710. Both

Machine-Tool Industry of the Poznań District - Machine Tool Production of the H.
Cegielski Plant

types have the same main drive and some hydraulic parts, but the CRB 710 radial saw operates with automatic repetition of its cycle. According to production plans the number of lathe types will be reduced and only capstan and automated capstan lathes will be produced by the H. Cegielski plant. Other types will be built by other plants. There are 13 photographs and 1 figure.

Abstract: In Poland 0.01% of aniline are added to turbine oils as an oxidation
inhibitor. For operation control of the concentration of this additive
an analytical method has been worked out which is based on con-
version of the aniline to tribromaniline. Data are presented that
confirm the sufficient accuracy of the proposed method.

1709. X-rays excited by protons on Zn, Cu, Ni,
Co, Fe. J. URBANEC AND C. SIRALNÍ. Czech. J. Phys.,
5, No. 1, 49-5 (1955) In Russian.

Measurements of the dependency of the intensity
of the K_{α} lines of X-ray radiation excited by protons
on the energy of the protons was carried out on five
adjourning elements. The measurements were carried
out for an energy of the protons between 400 and
700 keV. The X-rays were analysed by a NaCl
crystal in a Bragg spectrometer which was constructed
for work in a space having a strong background of
 γ -rays produced in the accelerating tube by parasite
nuclear reactions. The detection of the reflected
X-rays was carried out by a bell-type G.M. counter
in a lead shield. The current of protons from the
accelerator tube was focused on the target to a
diameter of 2 to 3 mm. The protons were separated
from the molecular ions by a magnetic analyser the
magnetic field of which was automatically adjusted

OVER

3

in such a manner that protons of all energies were always focused on the same place of the target. The ion current was integrated by an electronic integrator working linearly in the range $0\text{--}60\mu\text{A}$. The dependencies of the intensities of the K_{α} lines obtained differed somewhat from the dependencies foretold by Henneberg. The deviations are of the order of errors caused by statistical fluctuations on the one hand and probable small changes of the focus due to changes in the energy of the protons on the other. The experiment proved that the intensity of the K_{α} line decreased with increasing atomic number. An estimate of the ratio of the intensities could not be carried out due to the unknown primary and secondary extinction of the NaCl crystal used. Absorption measurements in the direct beam were therefore carried out and the dependence according to the theory of Henneberg was thereby proved.

Determination of the fission yield of barium-141 and barium-142. Jaromír Malý, Vladimír Knobloch, Dana Imrišová, Zdeněk Prášil, and Zdeněk Urbanec (Čes. akad. věd, Prague). *Chem. listy* 52, 218-230 (1958).—Fission yields and half-lives for Ba¹⁴¹ and Ba¹⁴² were detd. by the radiochem. method. The decay of Ba isotopes sepd. from irradiated U²³⁵ was measured both without and with an Al absorption foil. From the decrease of the activity of the pure Ba isotopes their radiation energy was detd. The relative fission yield of these isotopes was detd. from the ratio of their activities to the activity of Ba¹³⁹ and from the known fission yield of Ba¹³⁹. Fission yields (based on the fission yield of Ba¹³⁹ = 6.3%), radiation energies (as measured by the absorption method), and half-lives for Ba¹⁴¹ and Ba¹⁴², resp., are: $Y^* = 5.26 \pm 0.32\%$, $4.90 \pm 0.53\%$; $E_{\gamma} = 1.93 \pm 0.1$, 0.76 ± 0.07 m.e.v.; and $T_{1/2} = 18.3$ min., and M. Hudlický.

AUTHORS: Jan Urbanec, Jiří Kopecký, and Josef Kajfusz**TITLE:** Radiative Capture of Slow Neutrons by Atomic Nuclei**PERIODICAL:** Československý Časopis Pro Fysiku, 1959, Nr 4,
pp 339-346

ABSTRACT: The aim of this work was to fill in gaps and make more accurate measurements on low-energy states of a complex nucleus, i.e. at energies of 0.1 to 1 MeV on light elements: S, Cl, K, Ca, V, Mn, Hg. To increase accuracy, a large volume of target material was used. The source of neutrons was a Czechoslovak experimental reactor. The neutrons were taken from a horizontal channel of approximately 100 mm diameter. A bismuth filter of 200 mm thickness was used to reduce the background γ -radiation. The beam of neutrons was collimated by a collimator made of paraffin and Li_2CO_3 , (the arrangement is shown in Fig 1). The target material was enclosed in an aluminium cylinder 6 cm dia. x 4 cm long. The wall-thickness was approximately 35 mg/cm². In a single-crystal scintillation spectrometer, a crystal of sodium iodide (4.4 x 3.8 cm) was used. The pulses were analysed by a single channel amplitude

Card 1/2

Radiative Capture of Slow Neutrons by Atomic Nuclei

analyzer. The resolution of the spectrometer at 0.662 MeV was 8.7-8.9% for uncollimated γ -radiation. The energy levels and intensities of the various gamma transitions were found as the difference between two measurements: the first was taken with the target material in the aluminium cylinder and the second with the empty aluminium tube. Several parasitic radiations occurred in the spectrum. These were due to: reactions in the scintillating crystal, Compton scattering, annihilation radiation of energy 510 keV; etc. The absolute intensities of the transitions were found by comparison with a known reaction (Ref 6). The accuracy of this determination was better than 1.5%. The accuracy of measuring the energy was better than 1%. The results are summarised in Figs 4 to 8, and in Table 1. Table 1 also shows results of various other authors. Two new lines were discovered on V₅₂.

Card 2/2 There are 8 figures, 1 table and 14 references, of which 9 are English and 5 Soviet.

AUTHOR: Kajfusz, J.; Urbanec, J.

TITLE: Image function for single-crystal gamma-ray scintillation spectrometer

SOURCE: Technoslovacia, Bratislava, Slovakia, Vol. 1, No. 1, 1971, p. 1-10.

TOPIC TAGS: scintillation spectrometer, gamma ray spectrometer, single crystal spectrometer, image function, photoeffect, Compton scattering, pair production

ABSTRACT: The article describes a method for calculating the image-forming process which occurs when the energy of primary gamma rays is absorbed in a single crystal scintillation spectrometer with cylindrical counter. The calculation is performed with a view to the possibility of using it for calculating the response of a single crystal detector to a point source of gamma rays. An expression is given for the image function, which is valid for all demands on the programming, once the problem is developed it can be used for all types of detectors. The various assumptions underlying the calculations are specified, and the image function is written in a form that makes it easy to be applied to, and the image function is written in a form that makes it easy to be applied to,

separately the contributions from three basic methods of primary-radiation absorption, namely photoeffect, Compton scattering, and pair production. The probability for absorption of secondary quanta in the crystal is calculated exactly for the first time. It is also claimed that the analysis of the contribution from pair production is more exact than in other papers, with expressions derived for the absorption of secondary quanta by the crystal and the absorption of quanta from the primary radiation. The method of calculating the absorption of secondary quanta from the primary radiation is based on the theory of the absorption of quanta from the primary radiation by the crystal.

"Changes in the Activity of Cholinesterase in the Serum of Schizophrenics During Treatment with Neuroleptics."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 424 - 426

Abstract: Serum of schizophrenics in the first stage of the disease and during their first hospitalization was used in the study. Cholinesterase activity was controlled every 7 - 10 days in the course of the treatment. 12 patients treated with chlorpromazine, and 2 with perazine were used in the study. A direct correlation between the dose of the drug and the activity of the enzyme was found to exist. In 2 of the patients who had a very high cholinesterase activity before the treatment (197 and 203 units), there was no increase in the activity as a result of the administration of the drug. 2 Figures, 7 Western references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

"Some Pharmacological Properties of Thiolic and Disulfur (-S-S-) Analogues of Acetylcholine."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 426 - 428

Abstract: The role of acetylcholine in the CNS is discussed. In experiments on cats the pharmacological properties of thioglycolcholine (HSCh) and of dithiodiglycolcholine (ChSSCh) were investigated. Their influence on blood pressure was weaker than that of acetylcholine. Amounts of 10 gamma/kg of the compounds caused a strong excitation of respiratory activity, and 1 mg/kg caused a brief apnea. In experiments with isolated frog heart amounts of 0.01 to 1 gamma/ml caused a decrease in the amplitude of heart contraction and bradycardia. 10-1000 gamma/ml caused the cardiac arrest. The role of the 2 compounds in nervous transmission is discussed. 3 Figures, 5 Western references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

kušu. Bloodless measurement of blood pressure in dogs
in chronic experiments SCR. MED. (Brno) 1956, 29/3-4 (83-92)
Graphs 4 Tables 1

The methods so far devised are discussed and preference is expressed for the 'tunnel' method in which the pressure in the carotid artery is measured. Experi-
ments on dogs are reported. It is pointed out that a carotid sinus reflex must al-
ways be taken into consideration; this raises the blood pressure by about 9 mm.Hg.
Measurements were made after the animals had calmed down, a process which as
a rule takes 15 to 30 min. Both systolic and diastolic values were recorded. To
obtain figures of any value it is necessary to continue the experiments for 10-15
days and to take about 300 readings. Fluctuations of as much as 30-40 mm. Hg
may be observed.
