Title : Refresher courses for economists employed in the engineering branches of communications

Periodical : Vest. svyazi 11, page 17, Nov 1954

Abstract : Information is given on refresher courses, organized by the Krasnodar Regional office for communications, for economists working in the field of communications. Theoretical studies were combined with field training of the specialists in the Krasnodar Central Communications Engineering Branches. Suggestions are made for increasing the number of hours spent by the students for practical "on the job" training.

scintillation telescope 19

SOURCE: Pribory i tekhnika eksperimenta, no. 5, 1964. 103-106

TOPIC TAGS: particle physics, charged particle, scintillation telescope

ABSTRACT: An electronic circuit is described which permits the automatic isolation of ionization stops of charged particles by the author's method (see Abstract AP4047461). Events are isolated in which three simultaneous signals are connected by: $A(U_1/U_3)^x - B(U_1/U_2)^y = C$, where A, B, C, and x, y are constants, U_1, U_2, U_3 are the amplitudes of signals. The circuit depends for its action on the conversion of a power of the ratio of amplitudes of two pulses into a pulse whose amplitude is proportional to the above power. The possibility of using the

SOURCE: Zavodskaya laboratoriya, v. 30, no. 11, 1964, 1301-1308

TOPIC TAGS: rhenuim, chemical analysis, photometry, polarographic analysis, spectrography

ABSTRACT: This is a survey of work done on rhenuim analysis during the past 4 or 5 years. A very extensive literature, both Soviet and foreign, is reviewed, and summaries are given of numerous techniques falling under the following headings: gravimetric and titration methods, photometric methods, polarographic analysis, spectral methods, determination of trace quantities, and separation of rhenuim from accompanying elements. Under determination of trace quantities, kinetic and neutron activation techniques are reviewed separately. Separation techniques refer specifically to molybdenum and tungsten and to technetium. No critical evaluation is given for the different methods.

TITLE: Investigation of low-energy charged particles with the Cosmos 12, Cosmos 15, and Electron 2 satellites Report, All-Union Conference on Cosmic Ray Physics held at Apatity 24-31 August 1964

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 10, 1965, 1956-1961

TOPIC TAGS: primary cosmic ray, secondary cosmic ray, cosmic ray shower, proton interaction, pi meson

ABSTRACT: The authors, continuing earlier work of one of them (Zh. eksper. i teor. fiz., 35, 1076, 1958), have investigated the production of showers in matter by high energy protons and pions in order to acquire data for estimating the secondary background due to the surrounding material in rocket and satellite measurements of primary cosmic radiation. The measurements were performed at Aragats at an altitude of 3200 m above sea level. The investigated protons and pions were produced in lead by cosmic ray neutrons; their momenta were determined with the aid of a magnetic field, and their ionizing powers were measured with a sequence of five gas-

Card 1/3

6

filled proportional counters. After passing through the magnetic field and the proportional counters, the secondary particle entered an "interaction hodoscope," consisting of a layer of polystyrene, three thin (~ 15 g/cm²) layers of lead, and four thick (~ 43 g/cm²) layers of copper, with counter trays between them. The data are presented graphically as momentum versus ionizing power plots for the particles that exhibited different specific types of behavior in the interaction hodoscope. From the data presented it is concluded that 15% of the events recorded by a detector surrounded by 10-50 g/cm² of heavy metal will be shower events, that the probability of producing a penetrating shower increases with increasing momentum of the initiating particle, that a pion with momentum between 0.1 and 0.7 Bev/c is from two to four times more likely to produce a shower than is a proton of the same momentum, and that it will be difficult to identify primary cosmic ray electrons or γ -rays by observing the showers they produce unless the secondary particles are identified. "The authors express their gratitude to G.V.Khrimyan for discussing the results and for valuable remarks, and to G.G.Matevosyan, E.V.Patvakanyan, G.M.Smsaryan, V.S.Truzzyan, and A.A.Oganesyan for assistance with the work." TITLE: On the solutions of Einstein's equations
for axially symmetric fields

PERIODICAL: Akademiya nauk Armyanskoy SSR. Izvestiya,
v. 15, no. 6, 1962, 83 - 87

TEXT: Olijnychenko (Nuovo Cimento, 21, 389,
1961) has considered Weyl's solution and has shown that in the
case of a static field with an arbitrary metric

$$ds^2 = Xdx^2 + Ydy^2 + Zdz^2 + fdu^2, \quad (1.5)$$

there are no solutions with non-zero distribution of matter.
It is now shown that this paradox could be eliminated by the
use of the following expression

$$T^{ik} = (p + \epsilon) u^i u^k + p g^{ik}. \quad (1.8)$$

Card 1/2

On the solutions ...

S/022/62/015/006/005/006
D218/D308

Next, it is shown that a static field cannot be axially symmetric. However, a uniformly rotating body can have an axially symmetric field. The metric of an axially symmetric distribution of matter cannot be diagonal. The final section of this paper is concerned with a variational derivation of T_{ik} , which leads to well-known expressions but might be of methodological interest. The method is based on the variation of the action integral

$$S = \frac{1}{c} \int \Lambda \sqrt{-g} d\Omega \quad (3.1)$$

TITLE: On the collapse of gravitating masses
PERIODICAL: Akademiya nauk Armyanskoy SSR, Izvestiya,
v. 15, no. 6, 1962, 89 - 91

TEXT: Oppenheimer and Volkoff (Phys. Rev., 56, 455, 1939) have discussed the behavior of degenerate stars whose masses exceed the mass of the sun. They assumed the pressure to be zero and showed that on this approximation the field equations used in the above paper, indicate that the pressure gradient is also zero, which is inadmissible. One should assume that

$$ds^2 = c^2 e^{\sigma} d\tau^2 - e^{\mu} (d\theta^2 + \sin^2 \theta d\varphi^2) - e^{\omega} dR^2 \quad (4)$$

where σ , μ and ω are functions of R and τ . It is noted that Einstein's equations corresponding to this metric have not as yet

Card 1/2

On the collapse of ...

S/022/62/015/006/006/006

TITLE: Energy losses of strongly interacting particles in hydrogen

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,
no. 6 (12), 1962, 2143-2145

TEXT: The energy losses of nucleons and pions due to strong interactions during passage through hydrogen are calculated using experimental data of V. P. Dzhelepov, B. M. Pontekorvo (UFN, 64, 15, 1958) and others. It is assumed that the particles lose the main part of their energy by collision. In that case the sum of the non-elastic losses $(dE/dx)_R = (N/A)T_0\sigma_R$ is larger than the real energy losses. N denotes the Avogadro number, A the atomic weight, T_0 the kinetic energy of the incident particle and σ_R the

total cross-section of all non-elastic processes. Assuming that the incident proton energy is 675 Mev formula above yields

$(dE/dx)_{\pi^0(+)} = 1.34 (5.26) \text{ Mev}\cdot\text{cm}^2/\text{g}$. If the energy spectra of the

Card 1/2

Energy losses of strongly ...

S/056/62/043/006/029/067
B125/B102

generated particles are known a more exact formula can be obtained, e.g.
 $(dE/dx)_{\pi^+} > N \int (\mu + t) \sigma(\psi, t) dt d\Omega$, where t is the kinetic energy of the

mesons produced and μ the positive-pion mass. The experimental curves $\sigma = \sigma(\psi, t)$ of A. G. Meshkovskiy et al. (ZhETF, 31, 560, 1956) yield 10.19 Mev·cm²/g for the total strong interaction losses if the angle has the values $\psi = 29, 46, 60, 75, 90, 105, \text{ and } 120^\circ$. At 300-400 Mev these losses are the same as the electromagnetic losses; at higher energies they exceed those. The energy losses of charged pions, calculated by similar methods, have a maximum at about 200 Mev. This maximum is due to the resonance character of the interaction. The maximum energy losses of positive pions are nearly three times larger than the losses of negative pion. There are 2 figures.

AUTHOR: Vartanyan, Yu. L.

TITLE: Mass and radii of baryon configurations

SOURCE: AN ArmSSR. Izvestiya. Ser. fiz.-matem. nauk, v. 16, no. 6, 1963, 137-145

TOPIC TAGS: baryon star, hyperon nucleus, superdense star, equation of state, degenerate gas, real gas

ABSTRACT: Various parameters of equilibrium stellar configurations have been calculated, making use of the equations of state

$$\rho = K_n \sum_a \left(\frac{m_a}{m_n}\right)^4 (\text{sh } t_a - t_a) + \rho_0,$$

$$P = \left(\frac{1}{3}\right) K_n \sum_a \left(\frac{m_a}{m_n}\right)^4 (\text{sh } t_a - 8 \text{ sh } t_a/2 + 3t_a) + P_0,$$

where

$$K_n = m_n^4 c^3 / 32 \pi^2 h^3$$

Card 1/3

ACCESSION NR: AP4010028

c - speed of light, m_k - mass of k -th particle, $t_k = 4 \operatorname{arcsinh} P_k/m_k c$, and the equation

$$u(r) = \frac{c^2 r}{2k} (1 - e^{-1}).$$

These equations were integrated numerically by the Runge-Kutta method at the Vy*chislitel'nyy Tsentr, AN ArmSSR (Computer Center, Academy of Sciences, Armenian SSR) from initial conditions $u(0) = 0$ and $P = P(0)$. Results were obtained for the radii, mass, hyperon nuclei, and shells of various stars. These results show the greater part of the mass to be concentrated in the hyperon nuclei of the stars. Graphical representations were obtained for the overall mass and radius of the star as a function of density at the center of the star for real and for ideal gases. The mass-versus-density curve shows an oscillatory character. "The author thanks G. S. Saakyan and E. V. Chubaryan for their help and advice." Orig. art. has: 8 formulas, 4 tables, and 2 figures.

the center to the surface; these phases correspond to the densities: above nuclear, nuclear and below nuclear. It is shown that when $\rho > 3.3 \cdot 10^{14} \text{ g/cm}^3$ the matter for the most part consists of baryons. The concentration of Leptons is several orders of magnitude less than the concentration of each of the types of baryons. At greater densities the concentrations of all types of baryons are of the same order of magnitude. In the region $6.7 \cdot 10^{13} < \rho < 3.3 \cdot 10^{14} \text{ g/cm}^3$ the matter consists of baryon-lepton gas. The ratio of the quantities of neutrons and protons changes in this interval from 157:1 to 21:1. The quantity of electrons is equal to the quantity of protons. The protons appear beginning at $\rho \sim 6 \cdot 10^{13} \text{ g/cm}^3$. When $\rho = 2.5 \cdot 10^{11} \text{ g/cm}^3$ the "generation" of neutrons begins. In the region $2.5 \cdot 10^{11} < \rho < 6.0 \cdot 10^{13} \text{ g/cm}^3$ the matter consists of neutrons, atomic nuclei and electrons. The energy density and pressure are determined for the most part by neutrons. When $\rho < 2.5 \cdot 10^{11} \text{ g/cm}^3$ matter consists of atomic nuclei and an almost ideal electron gas. For densities $> 1.5 \cdot 10^{13} \text{ g/cm}^3$ the approximation of an ideal gas is inexact and interaction between baryons must be taken into account. Baryons and leptons, unstable under ordinary conditions, become stable in

in the degenerate gas at certain boundary values ρ , different for different particles. The authors conclude that the concept of the possibility of existence of purely neutron configurations should be abandoned because a predominance of neutrons occurs only in a relatively thin layer of a superdense stellar model. Bibliography of 27 items. A. Masevich.

AUTHOR: Vartanyan, Yu. L.ORG: Byurakan Astrophysical Observatory (Byurakanskaya astrofizicheskaya observatoriya)

TITLE: Model of an expanding superdense celestial body

SOURCE: Astrofizika, v. 2, no. 1, 1966, 45-52

TOPIC TAGS: static mass concentration, white dwarf density, nonstatic body, expanding universe, perturbed static body, degenerated neutron gas, adiabatic index, ultra-relativistic Fermi gas

ABSTRACT: Masses of static concentration change slightly when the central density changes from very great values to the densities characteristic of white dwarfs. The problem of nonstatic bodies is discussed. An attempt is made to prove that an infinite dilation of a nonstatic mass concentration cannot lead to a collapse. The proof is based on a formula of the metrics for an expanding universe:

$$ds^2 = e^\sigma dt^2 - r^2 (d\theta^2 + \sin^2 \theta d\varphi^2) - e^\omega dR^2,$$

where the exponents σ and ω and the distance r are functions of the coordinate R and

Card 1/2

L 25974-66

ACC NR: AP6015747

time t . The equation of the expanding universe may be integrated if the initial conditions are known. The case in which the matter at the initial moment is in a quiescent state is discussed. Nonstatic configurations may be considered as perturbed static bodies under given initial conditions. If the density of a degenerated neutron gas changes from very great values to zero, the adiabatic index changes gradually from 1 to $5/3$. An addition of mass to the configuration of equilibrium causes a contraction, and a subtraction of masses creates a dilation. These processes take place until the star attains a stable position according to the density curve. An addition of mass to an unperturbed configuration with maximum mass leads to a collapse in the process of contraction. The analysis of a model of ideal ultra-relativistic Fermi gas, whose mathematical expression of state is simple, shows that this gas can dilate as well as contract. These processes may occur when the gas concentration has a negative mass defect. Orig. art. has: 22 formulas. [EG]

TITLE: Lubricating oil for bushings. Class 23, No. 184997

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 16, 1966, 73

TOPIC TAGS: lubricant, bushing, petroleum

ABSTRACT: An Author Certificate has been issued describing a lubricant for bushings, with a solar fraction and mazut base. To expand the operating temperature range of the oil, a petroleum fraction with a boil-away of 4-5% at 240-320C is added to the lubricant. This fraction is obtained from the petroleum distillate at 300-310C. [Translation] [NT]

"The History of the Discovery of the Causative Organism of Soft Sore."

Vest. Vener. Derm. No. 1, 31-34, Jan.-Feb., 1950.

It is incorrect to suppose that Ducrey discovered the bacillus responsible for chancroid. This micro-organism was first described as a streptobacillus in 1877 by Professor Oscar V. Petersen, a Russian scientist, two years before Ducrey's publication. The bacillus was first obtained in pure culture by two other Russian scientists, Istamanov and Akopyants, who employed as culture medium human skin, agar-agar, and water. Their results were communicated to the Medical Society of the Caucasus in 1897, a year before the work of the French microbiologist, Lenglet, was published.

692. A STUDY OF CLINICAL ASPECTS OF TROPHIC SKIN LESIONS RESULTING FROM TRAUMATIC DAMAGE TO PERIPHERAL NERVES OF THE UPPER AND LOWER LIMBS (Russian text) - Vartapetov A. Ya. Tbilisi - SBORN. TRUD. GRUZ. KOZHNO-VENER. INST. (Tbilisi) 1957, 7 (11-26)

106 patients with gunshot wounds involving peripheral nerve trunks of the limbs remained under observation. In 55 cases the nerves were completely severed, and in 40 cases partially or completely interrupted. Various trophic changes in the skin of the parts distal to the wounds developed in 105 patients, viz. cyanosis, infiltration, reddening or pallor of the skin, hyperhidrosis or anhidrosis, keratosis, hyperkeratosis, atrichosis, xerodermia, asteatosis, peeling, excessive pigmentation, trophic ulcers and unguis dystrophy. The intensity and nature of the changes were dependent on the level and degree of the nerve wound; they were more common and more intense in cases of partial nerve injury. This was due to prolonged central stimulation, interference with subcortical functions and appearance of foci of stimulation in the cortex as a result of such injury. Trophic changes developed not only in the limb affected but also in the contralateral limb.

Colloidal solution of benzene in various soaps A. M.
 Shkedin, G. P. Tikhonova and N. K. Pospelova.
 Khim. 1954

The findings of Redliger (Kolloid. Zh. 8, 167, (1946)) and of Pospelova (Dokl. Akad. Nauk SSSR, 1976) concerning the dependence of colloidal sol on the concentration of the soap were confirmed. In their ability to dissolve benzene the soaps can be arranged in the following order: III > I > II > IV. This suggested that the ability of soaps to dissolve colloidal hydrocarbons does not indicate their washing ability. The sol. of benzene in I did not change with temp., whereas in II it rose from 0.46 g/100 ml. at 20° to 1.10 g/100 ml. at 30°.
