Ferric compounds obtained by reducing nitrobenzene with metallic iron. I. I. Riskin. *J. Applied Chem.* (U.S.S.R.) 19, 118-53(1946). The object was the investigation of the conditions controlling the color of the oxides formed by the reduction of $PhNO_2$ in the presence of Fe. The expts. were undertaken to investigate the possibility of using colored Fe oxides as pigments. The color and the nature of the ppt. obtained by this reduction process depend on the nature of the electrolyte. Electrolytes consisting of nonhydrolyzing heavy-metal salts (Fe, Mn, Zn) and salts of the alkali or alk. earth metals give a black ppt. formed either by Fe_3O_4 or by a mixt. of Fe_3O_4 and Fe_2O_3. Electrolytes consisting of salts which hydrolyze (Al, Cr, Sn) give oxides whose compn. and color depend on the nature and concn. of the electrolyte. At low concns. the oxide formed is black Fe_3O_4; when the concn. is increased to a certain limit characteristic of each electrolyte yellow oxides appear. The shade of these oxides can vary from light yellow to reddish brown, depending on the different mixts. of oxides and hydroxides formed. These results and a preliminary investigation of direct interaction between various electrolytes and Fe, lead to the following conclusions: The reduction of nitrobenzene is affected mainly by the products of hydrolysis of the electrolyte used in the reaction and not by the salts initially present in the soln. The color of the ppt. formed is unaffected by the hydroxides of metals which cannot hydrolyze but is detd. by the electrolytes which can hydrolyze; Al salts appear to be the most efficient. **II. Light-yellow ferric hydrate—methods of obtaining and technical properties.** I. Riskin and ~~I. Velikoslavinskaya~~. *Ibid.* 262-70.—With $AlCl_3$ as the electrolyte, when the concn. is increased, the oxides formed pass from a mixt. of Fe_3O_4 and FeO (low concn.) to pure Fe_3O_4, and finally to a stable hydrated oxide which does not change on further increase of the concn. of $AlCl_3$. The color of the ppts., however, varies continuously even when the compn. remains const. With $AlCl_3$ + $FeCl_3$ the optimum color and compn. of the ppt. corresponding to 20% $AlCl_3$ can be reproduced with 7% $AlCl_3$ if an adequate amt. of $FeCl_3$ is present in the soln., the total amt. of Fe ions corresponding to the result of the reaction between Fe and 20% $AlCl_3$ in absence of $FeCl_3$. The presence of $FeCl_3$ in the electrolyte not only stimulates the reduction reaction but also conditions the color and the compn. of the desired ppt. When $FeCl_3$ is replaced by other types of chlorides, it becomes impossible to obtain iron hydroxide in general, and the yellow hydroxide in particular, even in presence of important proportions of $AlCl_3$. The presence of aluminum sulfate reduces the velocity of reduction (while iron sulfate does not); the ppt. is dull, and its color changes when it is mixed with oil. Impurities present in the Fe affect the shade and the purity of the color. The hydroxide formed in a mixt. of $AlCl_3$ + $FeCl_3$ gives a pigment whose oil absorption is low and whose covering capacity is higher than those of other com. metallic pigments. **III. Influence of certain factors on the composition and color of**

Preparation of titanium oxide for the viscose industry. L. Velikoslavinskaya. *Novosti Tekhniki* 1940, No. 19, 29.—The TiO_2 product contains about 50-60% material of 1 μ and 16-37% of up to 0.75 μ. The TiO_2 is thru subjected to wet grinding and hydro-sepn. The stable suspension necessary for hydro-sepn. should have a TiO_2 concn. not greater than 150-160 g./l. Alkali was found to be a good stabiliser for the suspension. The suspension is coagulated by electrolytes and the TiO_2 flakes are sepd. from the liquid by decantation. B. Z. K.

Hydrolysis of titanium sulfate. B. A. Tsarev and T. A. Vel'koslavinskaya. *Byull. Obmen Opyt. Lakokrasochnoi Prom.* 1939, No. 6-7, 26-7; cf. *C. A.* 34, 8019.- Evapn. of hydrolyzing solns. of Ti sulfate shows reversibility of the reaction. It is known that solns. contg. 120 g. TiO_2 per l. and having an acid value of 4 hydrolyze to the extent of 80%. At the end of hydrolysis the acid value increases to 100. Soln. begins when the acid value is 12-17. However, if evapn. of the soln. is stopped when an acid value of 17 is reached, hydrolysis reaches 95%. Toward the end of hydrolysis the acid value reaches 40. Evapn. of hydrolyzing solns. changes 2 variables simultaneously; it increases the acidity of the medium and increases the b. p. of the soln. Titanyl sulfate and metatitanic acid can be hydrolysis intermediates.

18

Hydrolysis of titanium sulfate. B. A. Tsarev and Velikoslavinskii. *Byull. Labs-Issledovatel. Prom.* 1938, No. 6-7, 39-45; *Khim. Referat. Zhur.* 2, No. 2, 107(1939). —As a result of preliminary expts. for the prepn. of TiO_2 by hydrolysis of dil. solns. of $Ti(SO_4)_2$ (about 120 g./l.), products of satisfactory filtering properties and color were obtained. Three methods were used: (1) a preliminary hydrolysis of 10–20% of the total vol. of soln. at a concn. of $Ti(SO_4)_2$ of 250 g./l. followed by addn. of dil. $Ti(SO_4)_2$ with a ratio (R) of active acid to TiO_2 of 2.45 or 2.58; (2) a preliminary hydrolysis of the $Ti(SO_4)_2$ soln. (R = 2.65) equal to 10–20% of the total vol., followed by the addn. of basic or neutral sulfate; (3) hydrolysis of the weak $Ti(SO_4)_2$ solns. with R = 2.44 in the presence of ZnO. The ZnO increased considerably the velocity of hydrolysis during the first hr., after which the velocity dropped sharply. Tests of direct hydrolysis of dil. basic or neutral solns. gave products of poor filtering properties.

TITLE: Photographic nystagmograph. 10 Class 30, No. 186078

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 88

TOPIC TAGS: vision, nystagmus, nystagmography, photographic nystagmograph, photography, medical research

ABSTRACT: An Author Certificate has been issued for a photographic nystagmograph. The device consists of a rotating disk with variously colored objects attached at

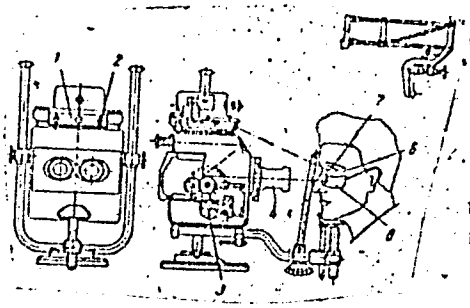

Fig. 1. Photographic nystagmograph

1 - Rotating disk; 2 - test objects; 3 - photographic recorder; 4 - optical system; 5 - ball mirror; 6 - wire cantilever; 7 - contact lens; 8 - half mask; 9 - cantilever for horizontal nystagmography.

various distances from one another. Also included is a mechanism for photographically recording nystagmograms. An optical system is used to observe the subject's eye visually. To reproduce nystagmus and its photographic record accurately with a minimum of preliminary adjustment, the device is equipped with a reflecting ball mirror as shown in Fig. 1. A variation of the above is designed to obtain a sharp nystagmogram by virtue of the half-mask shown in Fig. 1; either black chamois or dark green cloth can be attached to the mask as a background for the mirror. A second variation is equipped for nystagmography when patients are bedridden, using a cantilever which can be attached to the back of the bed and shifted in various directions (see Fig. 1). Orig. art. has: 1 figure.

Title : The Application of Methods of Stimulation in Agriculture and the Results of Experiments in 1954.

Orig Pub : Izv. In-ta biol. B"lg. AN, 1956, 7, 3-40

Abstract : A description is given of the results of experiments on stimulation of plant growth which have been conducted in Bulgaria since 1952. Stimulation of rice, sugar beet, corn, tobacco, and cotton by soaking the seeds in 2-3% potassium bromide solution or a 1% hydroquinone solution proved successful.

"Case of Intoxication by Bread Prepared From Flour Infected With 'Intoxication Fungus' (Fusarium roseum)" by L. A. Velikov and Yu. A. Troitskiy, Sbornik Nauchnykh Trudov Kuybyshevskogo Instituta Epidemiologii, Mikrobiologii i Gigiyeny (Collection of Scientific Works of the Kuybyshev Institute of Epidemiology, Microbiology, and Hygiene) 1956, 2, 142-144 (from Sovetskoye Meditsinskoye Referativnoye Obozreniye, Zdravookhraneniye, Gigiyena i Sanitariya, Istoriya Meditsiny, Moscow, No 20, 1956, abstract by Ye. Vishnevskaya, p 76)

"A case of mass intoxication (49 persons) by bread prepared from flour infected with the 'intoxication fungus' is described. The bread consisted of a heavy, 'gluey,' poorly baked dough; it had a musty color and slightly bitter taste. An analysis of the flour disclosed that in addition to its organoleptic properties it was characterized by a low gluten content (to 10 percent), a diminished ability to ferment, an acidity two to three times higher than normal, a positive reaction to hydrogen sulfide and ammonia, and an increase in the number of free amino acids to 95 to 160 milligram percent (normal 30 to 40 milligram percent). An extract of the flour infected with the fungus produced an instant and highly intensive biuretic reaction. A pure culture of the fungus was successfully grown. All data pointed to the necessity for a broad and thorough method of inspection of flour infected with the 'intoxication fungus.' Symptoms of intoxication were headache, dizziness, nausea, vomiting, general weakness, and unstable locomotion. The symptoms were similar to those caused by alcohol intoxication." (U)

Orig Pub : Ovoshcharstvo i Gradinarstvo, 1957, No 2, 39-40.

Abstract : A choice onion used for planting of the Lyaskovskiy 58 variety was treated with a potassium bromide solution 3 : 1000 for one hour before sowing. The control plant was treated by water. These experiments were conducted at the Institute of Biology, Bulgarian Academy of Sciences and in the vegetable selection station of Gorna Oryakhovitsa in 1953-1954. The experiment plants were distinguished by their greater height and produced an average of 276.5 cwt/ha for three years as compared to a yield of 225.2 cwt/ha in the control plants. -- V.S. Shmal'ko

Title : The Effect of Temperature in the Stimulation of Rice Seeds. Preliminary Report.

Orig Pub : Izv. In-ta biol. B"lg. AN, 1956, 7, 73-83 (bolg.; rez. russk., rem.).

Abstract : Laboratory experiments made at the Institute for Biology im. M. Popov. Rice seed stimulation in a 0.3% solution of KBr or a 0.1% solution of tannin for 48 hours increased the power of germination. By raising the temperature to 40° the stimulation process was speeded up and reduced from 49 to 5 hours.
