TITLE: The Influence of Physico-chemical Properties of Lubricating Oils on Energy Losses in Gear Transmission (Vliyaniye fiziko-khimicheskikh svoystv smazochnykh masel na poteri energii v shesterenchatoy peredache)

PERIODICAL: Khimiya i Tekhnologiya Topliva i Masel, 1957, No.7,
pp. 39-42 (USSR).

ABSTRACT: An investigation of the dependence of energy losses in gear transmissions on the properties of lubricating oils was carried out using various industrial gears as well as models. The oils investigated and their properties are given in the table. Altogether 3 series of experiments were carried out; in the first series, the dependence of energy losses on oil temperature was established using special low r.p.m. gears, and on automobile gears MAZ-51; in the second and third series, the relationship between energy losses and oil viscosity at various gear speeds and various loads. The experimental results are shown in graphical forms, Figs. 1-4. It was established that increasing energy losses with decreasing oil temperatures for oils of different chemical composition and produced by different methods are determined only by increases in their viscosity.

Card 1/2

The Influence of Physico-chemical Properties of Lubricating Oils on
Energy Losses in Gear Transmission 65-7-7/14

The law of the dependence of energy losses on the viscosity of oil is general for all gear aggregates. It is independent of such factors as geometry of gears, the number of joined pairs of gears, the shape and dimensions of the gearbox, etc. On changes of the above factors, only the absolute value of the energy losses changes. The energy losses in a gear transmission are determined not by whipping of oil nor by its spraying on and swirling, but by the resistance in streams formed during the rotation of gears, i.e. by viscous resistances. In order to decrease the latter, oils of a minimum permissible viscosity (consistent with wear resistance requirements) and a flat temperature-viscosity curve should be used. There are 4 figures and 5 Russian references.

TITLE: New method of evaluating the effectiveness of anti-seizing additives to oils and fuels

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 6, 1962, 546, abstract 6M297 (Sb. "Prisadki k maslам i toplivam", M., Gostoptekhizdat, 1961, 273-278)

TEXT: To evaluate the anti-seizing properties of lubricating materials, a new design of friction machine is developed, simulating the operating conditions of a friction couple in real mechanisms in respect of slip speed (0.5-30 m/sec), temperature (up to 200°C), and periodicity of contact in a wide range of variations (a diagram of the friction machine KB-1 (KV-1) is given). A method is proposed for a comparative evaluation of the anti-seizing properties of lubricating materials and other petroleum products (e.g., jet fuels). The anti-seizing properties of some petroleum products are investigated in the pure state and with additives. It is shown that the device and method of evaluation proposed are characterized by high sensitivity. [Abstracter's note: Complete translation.]

TITLE: Effect of additives on anti-wear properties of fuels ✓

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 6, 1963, 60-65

TOPIC TAGS: additives, anti-wear, fuels; anti-oxidants, dispersant stabilizers, metal deactivator, surface-active additives

ABSTRACT: The anti-wear properties of fuels T-1 and TC-1 (naphtha-kerosene fraction) and T-2 (naphtha-kerosene-benzene fraction) were investigated. T-1 showed best and T-2 the worst anti-wear properties; increasing temperature from 20 to 150 degrees noticeably reduced the anti-wear properties. Addition of small amount (0.01% by weight) of antiwear additives (s-organic compounds, or thiophosphoric acid esters) developed for oils, increased anti-wear properties of the fuels to the same extent as the addition of anti-oxidants and dispersant stabilizers. A metal deactivator showed very little surface-active effect, but surface active phenols or phenylenediamine improved fuel stability.

TITLE: Influence of polyisobutylene¹ on the wear-resistant properties of an oil base

II, 44

SOURCE: Khimiya i tekhnologiya topliv i masel, n. 12, 1965, 44-47

TOPIC TAGS: lubricant, lubricant additive, polyisobutylene, organic lubricant

ABSTRACT: The effect of polyisobutylene additive on the wear-resistant properties of a number of lubricating oils¹ was studied. The experimental technique employed is described by K. I. Klimov and A. V. Vilenkin, (Avtor. svid. No. 121967). The dependence of the critical load on the concentration of polyisobutylene, the effect of the molecular weight of the polyisobutylene on the wear-resistant properties of the oils, and the temperature dependence of the latter were studied. The experimental results are presented in graphs and tables (see Fig. 1). It was found that the addition of polyisobutylene improved the lubricating properties of the oils, the effect being more pronounced the lower the molecular weight of the additive. The protective action of polyisobutylene decreased with increasing temperature. It is suggested that the additive improves the lubricating properties of the oil by forming a protective film on the frictional surface.

TITLE: A new method of estimating the efficiency of antiseizing additives to oils and fuels

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 42. Silovyye ustavovki, no. 10, 1962, 68, abstract 42.10.381. In collecton "Prisadki k maslам i toplivam". Moscow, Gostoptekhizdat, 1961, 273-278

TEXT: A basically new design of a friction-type engine with two intersecting cylinders and intermittent contact of friction surfaces has been developed for testing the antiseizing properties of additive-type lubricants. For a comparative analysis of these properties, it is necessary to simulate during the test the field conditions for sliding speed, contact of friction surface and temperature, over a large range of variation of these characteristics. A new method, simulating field conditions, has been devised for testing the antiseizing properties of lube oils; this method has been applied to the study of certain oil products including additive-type oils. It is shown that both the new type of test engine and the test method suggested, ensure a markedly higher test accuracy, in comparison with other methods and apparatus (e.g. the four-ball friction engine). There are 3 figures and 4 references.

TITLE: Protective storage of machinery by lubricant additives

SOURCE: Vestnik protivovozdushnoy oborony, no. 9, 1966, 69-70

TOPIC TAGS: lubricant additive, lubricant viscosity, lubricating oil /AKOR-1 additive

ABSTRACT: The AKOR-1 additive is obtained by processing certain low viscosity oils with nitric acid, followed by neutralization with alkali to which stearin has been added. Adding 3—20% of AKOR-1 to any regular lubricating oil will keep machinery free from rust for two to three years. The following percentages are used, according to conditions: 3% for machinery stored in heated places, 5—6% if stored in unheated places, 10% if kept in the open air, and 15—20% if stored in subtropical or coastal areas. The maintenance costs per motorized vehicle are

Card 1/2

L 02193-57

ACC NR: AP6032091

reduced by 32 to 46 rubles for five years if AKOR is used. The characteristics of regular oils to which AKOR-1 has been added are described in detail in a pamphlet entitled "Inhibited oils and fuels" (Inhibirovannyye masla i topliva) published by the Central Scientific Research Institute for Technical Information and Economies (Tsentral'nyy nauchno-issledovatel'skiy institut tekhnicheskoy informatsii i ekonomii) of Neftegaz (Coal and gas) in 1964.

III. The effect decompositions of topological

limiting the summands to one or another combination of

and sequence of LK groups and it in each of these we distinguish some open compact subgroup H_n , then the latter defines a direct sum G of the groups G_n with respect to the group H_n by means of the sequences $x = (x_1, x_2, \dots)$ with $x_n \in G_n$ for all n and $y(H_n)$ for almost all n . The topology of G is of type L/K . The decomposition of x into a sum of those x for which $y(H_n)$ for all n is unique and contained in G and is distinguished by the decomposition of x . This leads to a definition of the decomposition of x into a sum of open compact subgroups H_n of G . The decomposition of an element of G into a sum of open compact subgroups of G is unique.

The paper is mainly devoted to the study of the so-called *exceptional* $L(K)$ groups of type P , here, for a fixed prime p , $n \geq 0$ as $n \rightarrow \infty$. It is known that there are four classes of such groups which are of type P and of rank one. The principal result of this paper is the following: if Γ is a group of type P that contains a subgroup Γ_0 of finite index, then Γ_0 is also of type P , being the first example of a direct complement of a finite group in a group of type P . The author wishes to thank Prof. J. P. Serre for his useful comments and for having sharpened by the referee some of the proofs.

Another important tool is the concept of a group H . This is defined by the algebraic properties $(\mu H \mu^{-1}) = \mu H \mu^{-1}$. An early theorem of two concepts, Theorem 2, is as follows: if μ is a d -Hausdorff compact subgroup of $\operatorname{Aut}(M)$, then μ is a d -Hausdorff compact subgroup of $\operatorname{Aut}(M)$.

Vilenkin, N. On direct decompositions of topological groups. II. Rec. Math. [Mat. Sbornik] N.S. 19(61) 14, 440-460 (1946). (Russian). English summary.

Summary: The author continues his study of direct decompositions of topological groups. In part I he studies necessary and sufficient conditions for decomposability into direct sums of groups of rank one.

This more extensive class is defined as follows. An Abelian topological group G is called coseparable if (1) there exists a complete system of neighborhoods of zero consisting of subgroups of G , (2) every noncompact subgroup of G satisfies an ascending chain condition on its closed subgroups, (3) G is the set-theoretic sum of a countable number of noncompact subgroups G_1, G_2, \dots , (4) an arbitrary set T is open in G if $T \cap G_n$ is open in G_n for every n . A group is

called weakly separable if it contains a subgroup M such that the factor group G/M is coseparable. It is shown that a group G is weakly separable if and only if G/H is separable in the sense of Krull (J. Reine Angew. Math. 184, 19-48, 1942; these Revs. 5, 228, 1943).

It is shown that a group G is decomposable if and only if it is weakly separable.

VILENKIN, N.

Vilenkin, N. On a class of complete orthonormal systems.

Bull. Acad. Sci. URSS. Ser. Math. [Izvestia Akad. Nauk SSSR] 11, 363-400 (1947). (Russian. English summary)

Let G be a compact Abelian group. Then as is well known the members of the character group X of G form a complete system of orthonormal functions on G with respect to the Haar measure on the latter. Consequently they may be used to expand functions on G in "Fourier series" whose terms are constant multiples of these characters. In this paper such expansions are considered in some detail for the special case in which G is zero dimensional and separable. In order to be able to discuss nonabsolute convergence the author introduces a sequential ordering in X . This ordering is related to the group structure of X but depends upon an infinite number of arbitrary choices and so is far from being intrinsic or natural in any sense. A related (nonsequential) ordering in G makes it possible to define functions of bounded variation. Using these notions the author obtains a number of theorems analogous to familiar ones in the classical theory of Fourier series. For example he shows that the Lebesgue constants of his series are $O(\log n)$ and that the series cannot converge to zero everywhere unless all the coefficients are zero. He asserts that by mapping G into the unit interval in a manner described by Fréidenthal it is possible to deduce theorems about orthonormal sequences of functions of a real variable from his results.

VILENKNIN N.YA.

Russian) Vilenkin, N.Ya. On the theory of weakly separable groups. Mat. Sbornik N.S. 22(64), 155-177.

The author introduced the concept of a weakly separable group in an earlier paper [loc. cit., Mat. Sbornik N.S. 19(61), 411-440 (1946); these keys 8 and 9]. In the present paper, there are definitions of separable and weakly separable groups, properties of a topological group (e.g., a compact group), and weakly separable groups. In the second section of this paper, the author studies weakly separable groups in the structure of a topological group. In general, the author proves that if a central subgroup, H , and a connected group, G , have properties of a weakly separable group, for example, if H and G/H are locally compact, then all of them satisfy the second countability axiom, or f -completeness, complete in the sense of A. Weil, then G has that property. If H is Abelian, and H and G/H are completely ℓ -separable (i.e., ℓ -dimensional), so is G . In § 2, the author proves that separable, complete (in the sense of and weakly) separable groups are complete in the sense of Weil, and are completely ℓ -dimensional, i.e., possess absolutely small compact neighborhoods. It is proved that a continuous, onto, and one-to-one mapping of a w.s.c. space onto a w.s.c. space is an open mapping. The term "correct subgroup" is introduced in § 3. A separable subgroup of a w.s.c. whose closure in G is also a separable subgroup is called a "correct subgroup". It is shown that the associated character group of a group is a c.g., and it is shown that the sum and product of two such subgroups is also correct. This and other results of the section are used to show that a w.s.c. is a topological group with a countable set of subgroups which satisfy the second countability axiom. Finally, there are some theorems on topological spaces which have an analogous character. In § 4, it is proved that the character group of a separable, complete, and ℓ -dimensional group is weakly separable. The author also demonstrates that this was also true in the case of a topological group with a countable character.

Source: Mathematical Reviews, 11/2

Vol. 1 No. 2

The remainder of the paper is devoted to primary groups associated with some prime, p . The following theorems occur in § 4. Theorem 12 asserts that if G is primary and w.s. and if H is a discrete subgroup such that $\rho H = H$ then H is a direct factor of G . Theorem 13 asserts that if G is primary and w.s. and H is a subgroup such that $\rho H \neq H$ then H is a direct sum of groups of type (α) where α is a divisor of $p-1$. Theorem 14 asserts that if H is a direct factor of G then H is a direct factor of ρG . Theorem 15 asserts that if G contains an open subgroup H such that $\rho H \neq H$ then G is a cyclic group, and Theorem 16 asserts that if G is a primary group of type (p^m) and if H is a direct factor of G then H is also of type (p^m) .

It is shown that if R is separable and $\alpha = \rho G$, then the decomposition of α into a direct sum of groups of type p and R is unique as is then an isomorphism. Next, an extension of earlier results on locally compact groups gives every regularly stratified primary, weakly separable G , which is not a group of rank one, decomposes into a direct sum of proper subgroups. In the concluding § 7 it is shown by simple examples that 1) if a group is not locally compact, it may be represented without being "completely" so; 2) a complete topological group may be zero-dimensional and not have arbitrarily small subgroups, and 3) if a complete topological group does not satisfy the second countability axiom, it may have factor groups which are not complete.

Salutations to You

Yours sincerely,

Vilenkin, N. Ya. On the classification of separable and coseparable topological Abelian groups. Mat. Sbornik N.S. 27(69), 85-102 (1950). (Russian)

The author defines an extensive class of groups which admit a theory completely analogous to that of the countable, primary, periodic groups. These are the normal, coseparable primary groups to be discussed. Another, similarly directed class of groups was announced previously by the author [Doklady Akad. Nauk SSSR (N.S.) 61, 969-971

(1948; these Rev. 10, 282]. Let G denote a coseparable primary group associated with a fixed prime p , notation and definitions as in [K. A. Mardia, Mat. Sbornik N.S. 19(61), 153-171, 340 (1946); Mat. Sbornik N.S. 23(64), 135-151, 192-201 (1948); these Rev. 10, 32, 33, 94 (1949)], excepting the definition of "coseparable".

Consider a family of some countable type, where $\alpha = \beta\gamma + \eta$, $\beta \in \prod_{\omega} \mathbb{Z}$, γ according as α has or has not a predecessor. Let $\beta[H]$ denote the set of elements of H of the form $\beta\gamma$ viewed over H . Let $\rho^{\alpha}H$ denote the intersection of cosets of the $p^{\alpha}H$. Let $\omega[H]$ denote the elements of H of order p^{α} and let $\omega[H]$ denote the elements of infinite order. A subgroup H of G is called "just-right" (vpolne pravil'no) if for every α of finite σ and every integer n

$$\rho^{\alpha+n}G \cap \rho^{\alpha}H = \rho^{\alpha}(\rho^nG \cap H).$$

Here, if α is of the second kind, $\alpha = \omega\gamma$, then $\rho^{\alpha}G = G_{\omega}$, and if $\alpha = \omega\gamma + n$, then $\rho^{\alpha}G = \rho^nG_{\omega}$. The group G is called normal if G has a subgroup H such that (1) H is open, (2) H is just-right, (3) $\omega[H] > 0$. The need for some restriction on the class of coseparable groups for the point of view of this work is shown by the rather simple example of two coseparable nonisomorphic groups G and G' so it that the factor groups G_s/G_{s+1} and G'_s/G'_{s+1} are isomorphic for every $s \geq 1$.

Vilenkin, N. Ya. On the theory of general noncommutative topological groups. [Russian]. New York: SSSR (N.S.)

71, 7013 (513) 719-46 (Russian)

A general topological group is a topological group in which the multiplication operation is not required to satisfy a commutative law. In this note the author proves that every topological group is the quotient of a Hausdorff topological group by a closed normal subgroup. This result was also obtained earlier (in a more general form) by G. W. Mackey (Cambridge, Mass.).

Vilenkin, N. Ya. On the determination of the dimension of a compact metric space by means of the ring of continuous functions on it. Uspeni Matem. Nauk (N.S.) 6, no. 5(45), 160-161 (1951). (Russian)

Let X be a compact metric space and let $C(X)$ be the ring of all real-valued continuous functions on X . Then the following two conditions are necessary and sufficient for X to have dimension n . (1) For every $n+1$ functions $\varphi_1, \varphi_2, \dots, \varphi_{n+1} \in C(X)$ and every $\epsilon > 0$, there exist functions $\xi_1, \xi_2, \dots, \xi_n \in C(X)$ such that $\|\varphi_i - \xi_i\| < \epsilon$ ($i = 1, 2, \dots, n+1$) and the functions $\xi_1, \xi_2, \dots, \xi_{n+1}$ are contained in no single maximal ideal of $C(X)$. (2) there exist $f_1, f_2, \dots, f_n \in C(X)$ and $\delta > 0$ such that if $g_1, g_2, \dots, g_n \in C(X)$ and $\|f_i - g_i\| < \delta$ ($i = 1, 2, \dots, n$), then g_1, g_2, \dots, g_n lie in a proper closed ideal in $C(X)$. This ring-theoretic characterization of dimension is to be compared with that given by Katětov [Časopis Pěst. Mat. Fys. 75, 1-16 (1950); these Rev. 12, 119].

Vilenkin, N. Ya. The theory of characters of topological
abelian groups with boundedness given. Izvestiya
Akad. Nauk SSSR. Ser. Mat. 15, 439-462 (1951)
(Russian)

This investigate the theory of character groups of an abelian general topological group G in which there is imposed a system of "bounded" sets, as defined by Hu [J. Math. Pures Appl. 28, 287-320 (1949); these Rev. 11, 452]. A class of subsets of G is a basis for this "boundedness" if every bounded subset of G is a subset of at least one of the members of the basis. The subset A of G is called quasi-convex if for every element g of G which is not in A there exists a character χ such that $\chi(g) \neq 1$ but $\chi(a) = 1$ for every $a \in A$. If each set of classes is replaced by its convex hull and in each neighborhood of the identity a basis of the identity of G is replaced by the quasi-convex hull one derives from G a generalized topological group G^* .

Let H denote the closure of the identity element of G^* . Then the factor group G^*/H is called the reduced group of G . It is shown to be locally quasiconvex and to possess a quasi-convex boundedness. The reduced group of the group of characters of G is more simply a Q-group. The group of characters of G and its reduced group are isomorphic and connected, and the reduced group is a closed subgroup of the reduced group of G . The boundary ∂X of the character group X of G neighborhoods $N(A)$ of the character group X of G $N(A) = \{x \in X, x(a) \geq \frac{1}{2}, a \in A\}$, and the neighborhoods of ϵ in G form a basis for boundedness in X .

The author studies involutory groups (groups isomorphic to the character group of their character group) and yes to the character group of their character group) and yes to the character group of their character group). The author studies involutory groups and shows that a closed subgroup of an involutory group is also an involutory group. The author also studies the properties of the character group of an involutory group and shows that the character group of an involutory group is also an involutory group. The author also studies the properties of the character group of an involutory group and shows that the character group of an involutory group is also an involutory group.

Vilenkin, N. Ya. On the classification of zero-dimensional locally compact periodic Abelian groups without elements of finite order. Mat. Sbornik N.S. 28(70), 503-536 (1951). (Russian)

This is a detailed paper on a substantial part of the author's extension of the theory of the discrete countable torsion groups. Some of the results were announced in an earlier note [Doklady Akad. Nauk SSSR (N.S.) 61, 969-971 (1948); these Rev. 10, 282] and part are contained in §10

of chapter II of a general expository paper [Uspehi Matem. Nauk (N.S.) 5, no. 4(38), 19-74 (1950); these Rev. 12, 78]. The author uses the principal results and follows the notation of his first paper on the direct factoring of topological groups [Mat. Sbornik N.S. 19(61), 85-154 (1946), these Rev. 8, 132]. The groups dealt with here are zero-dimensional, locally compact abelian groups G (i.e. of type NL in the author's notation), primary (i.e. for some fixed prime p and every cell $p^{\infty}G$ converges to the identity e in the topology of the integer π_1 with no elements of finite order, unitary $\{G\}=0$), and satisfying a condition known as completely proper stratification

$$p^nG \cap p^{n+1}G = p^n(p^{\infty}G),$$

for every finite integer n and every transfinite α for which the corresponding subgroups $p^{\infty}G$ consists of infinite length (inductively) defined as $\cup_{\beta < \alpha} p^{\infty}G(\beta)$

Vilenkin, N. Ya. On the isomorphism of locally compact zero-dimensional Abelian groups with isomorphic factors.

Mat. Sbornik N.S. 29(71), 31-62 (1951). (Russian)

It is proved that the pair $(G:H)$ determined in the paper reviewed above is unique, i.e., if $(G':H')$ is another pair corresponding to the same assigned invariants, then there exists an isomorphism of G onto G' such that H is mapped onto H' . The proof is given, first, for the case that G , and G' , are vacuous. The desired theorem then follows from theorem 2 that under the conditions on G there exists a closed subgroup T of G such that $G:H \cong T:(T \cap H) + G_0:(G_0 \cap H)$.

which is the projective space over \mathbb{F}_q . The set of points of $P(V)$ is the disjoint union of the sets $P(V_i)$, where V_i is the i -th component of V . The set of lines of $P(V)$ is the disjoint union of the sets $P(V_{i,j})$, where $V_{i,j}$ is the j -th component of V_i . The set of planes of $P(V)$ is the disjoint union of the sets $P(V_{i,j,k})$, where $V_{i,j,k}$ is the k -th component of $V_{i,j}$. The set of hyperplanes of $P(V)$ is the disjoint union of the sets $P(V_{i,j,k,l})$, where $V_{i,j,k,l}$ is the l -th component of $V_{i,j,k}$. The set of n -dimensional subspaces of V is the disjoint union of the sets $P(V_{i_1, i_2, \dots, i_n})$, where V_{i_1, i_2, \dots, i_n} is the n -tuple $(V_{i_1}, V_{i_2}, \dots, V_{i_n})$. The set of n -dimensional subspaces of V is the disjoint union of the sets $P(V_{i_1, i_2, \dots, i_n})$, where V_{i_1, i_2, \dots, i_n} is the n -tuple $(V_{i_1}, V_{i_2}, \dots, V_{i_n})$.

consequently, we can group in three ways. A definition is a theorem of the first kind; a theorem of the second kind is a theorem of the third kind if it involves one or more definitions. Theorems of the first kind are called *axioms*, and theorems of the second kind are called *theorems*. In the present paper, however, we shall use the term *theorem* for all theorems of the first and second kinds, and the term *axiom* for theorems of the third kind.

CARD 1/1

PG - 148

In his earlier papers (Mat.Sbornik,n.Ser. 28, 503-536; ibid. 29, 13-30; ibid. 29, 31-62; ibid. 33, 37-44) the author has generalized the results of Ulm to a class of locally compact zero-dimensional topological Abelian groups. In the present paper the author gives the results being dual to these results. There appears a class of groups which is dual to the earlier one. It is proved that both classes are special cases of a class of topological groups. To these latter one there belong, among others, all direct sums of the groups of rank 1 which have already been treated by the author (Mat.Sbornik,n.Ser. 19, 85-154 (1946)). For these groups the Ulm's factors are determined, they are direct sums of groups of rank 1. Therewith a certain system of numerical invariants is established. The question for the existence and uniqueness of a group with given invariants is not treated.

AUTHOR VILENIN N.Ja., AKIM E.L., LEVIN A.A.
TITLE Matrix elements of irreducible unitary representations of the group of Euclidean motions of a three-dimensional space and their properties.
PERIODICAL Doklady Akad. Nauk 112, 987-989 (1957)
reviewed 6/1957

At the Third Mathematical Union Congress Radov has presented an address on the computation of the matrix elements of the irreducible unitary representations of the group $M(3, R)$ of the Euclidean motions of a three-dimensional space. The authors carry out the computation of the same elements with the aid of an integral method. Here certain functions are appearing which satisfy certain relations which can be denoted as generalizations of well-known relations between Bessel functions. The authors give a theorem of addition and recurrence formulas for these functions which originate in it.

TITLE: Eigenfunctions of the Laplacian realizing the representation of the groups U(2), SU(2), SO(3), U(3), and SU(3), and the symbolic method

SOURCE: Moscow. Institut atomnoy energii. Doklady, IAE-838, 1965. Sobstvennyye funktsii operatora Laplasa, realizuyushchiye predstavleniya grupp U(2), SU(2), SO(3), U(3), SU(3) i simvolicheskiy metod, 1-21

TOPIC TAGS: Laplace operator, characteristic function, function analysis, group theory

ABSTRACT: In order to find the irreducible representations of the groups $U(n)$, in addition to the abstract-operative method, it is also possible to use the method employed by N. Ya. Vilenkin and Ya. A. Smorodinskiy (ZhETF, 46, 1793, (1964)). This method is based on the utilization of the Laplacian acting in the space of s_6 -homogeneous polynomials of the 6π degree. The solution obtained is used for the realization of the representation of the groups U(2), SU(2), SO(3), U(3), and SU(3). "The authors thank Yu. A. Danilov for his interest in the work and for discussions." Orig. art. has: 4 figures, 55 formulas, and an appendix with 10 formulas.

S/044/61/000/010/033/051

C111/C222

The deduction of some properties ...

The function $P_{mn}^l(\mu)$ is tightly connected with the Jacobian polynomials $J_s^{\alpha\beta}(\mu)$ by the relation

$$P_{mn}^l(\mu) = K(1 - \mu)^{\alpha/2} (1 + \mu)^{\beta/2} J_s^{\alpha\beta}(\mu),$$

where $\alpha = |m-n|$, $\beta = |m+n|$, $s = 1 - \frac{\alpha + \beta}{2}$, K is a certain constant depending on l , m , n . The author obtains the formula

$$\sum_{m=-1}^1 e^{-im\varphi} P_{mn}^l(\cos \theta) = [\sin((2l+1)\alpha)] / \sin \alpha,$$

where $\cos \alpha = \cos(\theta/2) \cos(\varphi/2)$. Besides, for the functions $P_{mn}^l(\mu)$ and for the Legendre polynomials, the author obtains a number of integral representations; an explicit expression and a multiplication formula for the functions $P_m^l(\cos \theta)$ are obtained; differential relations between the functions $P_{mn}^l(\cos \theta)$ are derived; a number of interesting relations

AUTHOR: Vilenkin, N.Ya. ✓
TITLE: On the Theory of Positively Defined Generalized Kernels
PERIODICAL: Uspekhi matematicheskikh nauk, 1960, Vol.15, No.3, pp.139-146
TEXT: Let $S_{1/2}^{1/2}$ and $S_{1/2}^{1/2}$ be the spaces defined in (Ref.1). Let \mathcal{M} be the set of all points $z(z_1, \dots, z_n)$ with real or purely imaginary coordinates z_k . Theorem 1: Let F be an even generalized function in $S_{1/2}^{1/2}$. In order that the inequation $(F, \varphi * \varphi^*) \geq 0$ is satisfied for every even function $\varphi(z)$ of $S_{1/2}^{1/2}$, it is necessary and sufficient that F is the Fourier transform of a uniquely determined even positive measure μ given on \mathcal{M} , where the integrals

$$\int e^{-cz^2} d\mu(z) \text{ for all } c > 0 \text{ shall converge.}$$

For the proof the theorem in a somewhat changed equivalent version is reduced with the aid of five lemmas to the theorem of Bochner-Schwartz. Theorem 2: Let F be an even generalized function in the space $S_{1/2}^{1/2}$. In order that for all even functions of this space it holds $(F, \varphi * \varphi^*) \geq 0$ it is

Card 1/3

S/042/60/015/003/007/016XX

On the Theory of Positively Defined Generalized Kernels

necessary and sufficient that F is the Fourier transform of a uniquely determined positive even measure given on \mathbb{R} , where for every $c > 0$ the integral

$$(10) \quad \int_{\mathbb{R}} (1+|x|^2)^{-p} e^{cy^2} d\mu(z)$$

✓

shall converge for a certain p ($z=x+iy$).

The author proves the theorem 2" dual with respect to the Fourier transformation, which asserts that for the validity of the inequation $(F, \varphi\bar{\varphi}) \geq 0$, where the even $F \in S^{1/2}$ is given and the even $\varphi(z) \in S^{1/2}$ is arbitrary, it is necessary and sufficient that $(F, \varphi) = \int_{\mathbb{R}} \varphi(z) d\mu(z)$, where μ is a measure

having the property mentioned in theorem 2.

Theorem 3 asserts that the considered even generalized functions for which

Card 2/3

TITLE: On an Estimation of the Maximal Eigenvalue of a Matrix

PERIODICAL: Uch.zap.Mosk.gos.ped.in-ta, 1957, 108, 55-57

ABSTRACT: For an arbitrary quadratic matrix $\|a_{ik}\|^n$ let the sums $s_i = \sum_{k=1}^n |a_{ik}|$ ($i=1, \dots, n$) be ordered into a decreasing sequence: $s_{m_1} \geq s_{m_2} \geq \dots \geq s_{m_n}$. Let $j=m_1$, $T_{ik} = s_i - |a_{ik}|$ ($i, k=1, \dots, n$) and

$$U_r = \begin{cases} \frac{1}{2} T_{rj} + a_{jj} + \sqrt{(T_{rj} - |a_{jj}|)^2 + 4T_{jj}|a_{rj}|}, & \text{for } r \neq j \\ s_{m_2} & \text{for } r = j \end{cases} \quad (r=1, \dots, n)$$

For the absolute values of the eigenvalues λ of the matrix $\|a_{ik}\|$ the following limit is given in the paper:

$$|\lambda| \leq \max_r U_r.$$

Remark of the reviewer: In the article the principal formula contains a misprint (instead of a_{rj} read $|a_{rj}|$). F.R.Gantmakher

Akademiya nauk SSSR. Vychislitel'nyy tsentr

Vychislitel'naya matematika (Computer Mathematics) Moscow, Izd-vo
AN SSSR, 1959. 148 p. (Series: Its: Sbornik, 5) Errata slip
inserted. 3,200 copies printed.

Resp. Ed.: V. A. Ditkin, Professor; Ed.: M. V. Yakovkin; Tech. Ed.:
S. G. Markovich.

PURPOSE: This book is intended for applied mathematicians,
scientific workers, engineers and scientists whose work involves
computation.

COVERAGE: This book contains 9 articles on problems in computer
mathematics. Three articles are devoted to problems of nomography.
There are individual articles on the numerical integration of
first order ordinary differential equations, the approximate
integration of multiple integrals, random values with arbitrary
distribution, stochastic processes and the Monte Carlo method,

Card 1/7

Computer Mathematics

Mathematika Prosvetcheniye; Matematika, Vysheeskaya, Matematika i Istoricheskaya, Its Teaching, Application and History, Mr.,

Moscow, Gosizdat, 1959. 15,000 copies printed.

Ed.: I.M. Bronfman, Editorial Board of Series: I.M. Bronfman, A.R. Markushhevich, I.M. Taganov, Tech. Ed.: S.M. Achlakov.

PURPOSE: This book is intended for persons without an extensive mathematical education who are interested in trends in contemporary mathematics. The book may be useful to high school mathematics teachers.

COVERAGE: The book consists of articles, reviews, and scientific and methodological reports, some of which are translations from other languages. The state of modern mathematics is covered, including applications, history, problems of mathematics in schools, and mathematical developments in the USSR and abroad. One section deals with scientific and pedagogical life in the USSR and another contains reviews of certain mathematical publications. Some mathematical background is necessary to understand the book; certain articles require a knowledge of higher mathematics.

TITLE: Some Relations for the Functions of Gegenbauer (Nekotoryye
sootnosheniya dlya funktsiy Gegenbauera)

PERIODICAL: Uspekhi Matematicheskikh Nauk, 1958, Vol 13, Nr 3, pp 167-172 (USSR)

ABSTRACT: The author proves the following relations:

$$\text{I. } c_n^p(\cos \lambda) = \frac{2 \Gamma(2p+n) \Gamma(p+\frac{1}{2}) \Gamma(2t)}{\Gamma(2p) \Gamma(p-t) \Gamma(n+2t) \Gamma(t+\frac{1}{2})} \int_0^{\frac{\pi}{2}} c_n^t\left(\frac{\cos \lambda}{\sqrt{\sin^2 \theta + \cos^2 \lambda \cos^2 \theta}}\right) \times \\ \times (\sin^2 \theta + \cos^2 \lambda \cos^2 \theta)^{\frac{n}{2}} \sin^{2t} \theta \cos^{2p-2t-1} \theta d\theta,$$

where $\operatorname{Re}(p) > \operatorname{Re}(t) > -\frac{1}{2}$.

II.

$$c_{n-k}^{p+k}(\cos \lambda) \sin^k \lambda = \frac{(-2i)^k \Gamma(2p-1) \Gamma(2p+n+k) \Gamma(p+k+\frac{1}{2}) k!}{\sqrt{\pi} n! \Gamma(2p+2k) \Gamma(2p+k-1) \Gamma(p)} \times$$

Card 1/3

Some Relations for the Functions of Gegenbauer

SOV/42-13-3-5/41

$$\times \int_0^{\pi} C_k^{p-\frac{1}{2}} (\cos \theta) (\cos \lambda + i \sin \lambda \cos \theta)^n \sin^{2p-1} \theta d\theta,$$

where $\operatorname{Re}(p) > 1$.

III.

$$C_n^p (\cos \psi \cos \theta + \sin \psi \sin \theta \cos \varphi) = \frac{\Gamma(2p-1)}{[\Gamma(p)]^2} \sum_{k=0}^n \frac{2^{2k} (n-k)! [\Gamma(p+k)]^2}{\Gamma(2p+2k-1)} \times \\ \times \sin^k \psi \sin^k \theta C_{n-k}^{p+k} (\cos \psi) C_{n-k}^{p+k} (\cos \theta) C_k^{p+\frac{1}{2}} (\cos \varphi).$$

IV.

$$\int_0^{\theta} -\frac{1}{2} + i\lambda \operatorname{ch} \theta p^{-\frac{k}{2}} + i\lambda \operatorname{ch} \psi p^{-\frac{k}{2}} - \frac{1}{2} + i\lambda \operatorname{ch} \mu \lambda \operatorname{th} \pi \lambda d\lambda = \\ = \frac{1}{\pi} \frac{T_k \left(\frac{\operatorname{ch} \theta \operatorname{ch} \psi - \operatorname{ch} \mu}{\operatorname{sh} \theta \operatorname{sh} \psi} \right)}{\sqrt{[\operatorname{ch}(\theta + \psi) - \operatorname{ch} \mu][\operatorname{ch} \mu - \operatorname{ch}(\theta - \psi)]}} \quad \text{if } |\theta - \psi| \leq \mu \leq \theta + \psi;$$

On the Diadicity of the Group Space of Bicomplete Commutative Groups
(O diadichnosti gruppovogo prostranstva bikompletnykh kommutativnykh grupp)

PERIODICAL: Uspekhi matematicheskikh nauk, 1958, Vol 13, Nr 6, pp 79-80 (USSR)

ABSTRACT: A question given by P.S.Aleksandrov is answered positively by the following theorem:

Let G be a commutative bicomplete group. Let $D_{\mathbb{C}}$ be a direct topological product of \mathbb{C} two-pointed Hausdorff spaces. Then there exists a continuous mapping of the space $D_{\mathbb{C}}$ onto G, i.e. G - considered as a topological space - is a diadic bicomplete.

There is 1 Soviet reference.
