closed by square-topped pulses. With positive pulses the input resistor is earthed in the center. Thus, the transfer coefficient of the amplifier is zero, with negative pulses it is finite. If the reciprocal of the pulse duty factor of the square-topped pulses corresponds to the second multiplicand, the output voltage is equivalent to the product of input voltage and the reciprocal of the pulse duty factor. The conservation of strict proportionality of the amplifier coefficient and the block diagram of a multiplication circuit shown in Fig. 2 are then discussed. The circuit is an electronic equivalent to a servosystem. It contains a group of operational amplifiers which are equivalent to the potentiometers of a servosystem. It allows the multiplication of two arbitrary input voltages. Under the supervision of senior designer V. B. Ushakov, Doctor of Technical Sciences, a simulator was developed at the otдел электрического моделирования НИИ Шетмаша (Branch for Electrical Simulation of the НИИ Шетмаш). A d. c. operational amplifier was used for the multiplication of a quantity which was variable from zero to a certain positive value, by nine different quantities. This operational amplifier contained two transformation blocks of types I and II. The

circuits of these types are shown in Figs. 3 and 4. Type I is a d. c. amplifier with triode keys at the input circuit. Type II consists of a direct current d. c. amplifier, a sawtooth generator and a Schmidt-trigger. In Fig. 2 type I corresponds to the amplifiers  $Y_1, Y_2, \dots, Y_n$ , type II to NO and BM. Engineers L. V. Achkasova, N. F. Bushko, and T. L. Solov'yeva took part in the investigations. There are 5 figures and 4 references: 3 Soviet and 1 US.

Building and Instrument Construction; V. V. Pokrovskiy, Engineer.

NOTE: This collection of articles is intended for scientists and technicians  
working in computer-aided building and related fields.

CONTENTS: This collection of articles presents the results of investigations  
related to the design and development of electronic computers. It contains  
the realization of some general and special algorithms by means of digital  
and analog computers, investigations errors in the realization of functional  
algorithms in electronic analogs, and various problems of computing and  
assigning the external outfit and arrangement of digital computers based  
on various principles of operation. Methods of computation and the basic  
characteristics of stabilized supply sources for digital and analog computers,  
methods of computing standard circuits, and problems related to half-pull-  
down are also considered. The personal data of the authors are given at the  
end of each article.

TITLE: An electrical model of a linear accelerator

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No.4, pp.25-26

TEXT: In view of the increasing number of electron accelerators which are either being built or are being designed, it is desirable to evolve methods for the preliminary calculation of the beam parameters. From this point of view the machines can be divided into two groups, namely, those with a working energy of less than 30 MeV and those above this energy. Design calculations carried out at МИФИ (MIFI) showed that in order to ensure the necessary beam parameters all the accelerators belonging to the second group can be discussed in terms of the same solution describing the electron dynamics during the acceleration process. The situation is different in the case of the first group, i.e. in the case of low energies. The electron dynamics in linear accelerators of this type can be described by the following equations:

Card 1/03

An electrical model of a linear ...

S/120/61/000/004/001/034  
E032/E514

$$\frac{dy}{d\xi} = A(\xi) \sin \varphi, \quad (1)$$

$$\frac{d\varphi}{d\xi} = 2\pi \left[ \frac{1}{\beta_B(\xi)} - \frac{1}{\beta_3} \right],$$

$$\gamma = (1 - \beta_3^2)^{-1/2},$$

where  $\varphi$  is the phase angle of the particle relative to the wave and  $\gamma$ ,  $\xi$ ,  $A$ ,  $\beta_B$  and  $\beta_3$  are the dimensionless energy, linear coordinate, electric field amplitude, wave velocity and electron velocity, respectively. This equation can only be solved by numerical integration. It is, therefore, interesting to produce an electrical model for this set of equations. A model is particularly useful if the electron energy is to be adjustable. The search for acceptable solutions can be reduced to the selection of functions describing changes in the accelerating wave amplitude

Card 2/3

and the phase velocity along the accelerator. The present authors have developed special apparatus which can be used to investigate phase oscillations and the output beam parameters for different forms of  $A$  and  $\beta_H$ , the stability of the beam parameters and the capture into the acceleration process under different working conditions. The figure shows the circuit employed. In electrical modelling the integration time represents the dimensionless accelerator length. The functions  $\alpha_H = \beta_H^{-1}(\xi)$  and  $\alpha_s = \beta_s^{-1}(\gamma)$  are generated by the non-linear units  $\text{BH}2$  (BN2) and  $\text{BH}3$  (BN3). A detailed description of this circuit is not given except that  $\text{SY}1$  (SU1) is an adding amplifier and  $\text{U}/3$  (IUZ) is an integrating amplifier. The phase trajectories obtained with this apparatus can be inspected visually on the screen of a CRO or photographed. Acknowledgments are expressed to A. V. Shal'nov, I. K. Ogorodova and Yu. V. Ogorodov. There is 1 figure.

AUTHOR: Vitenberg, M. I. (Leningrad)

TITLE: Dependence of the Winding Overheat and the Heat Exchange Coefficient of a Relay on the Temperature of Surrounding Air

PERIODICAL: Avtomatika i telemekhanika, 1960, Vol 21, Nr 3, pp 384-392 (USSR)

ABSTRACT: The winding overheat and the heat exchange coefficient are investigated as functions of the ambient temperature for three types of Soviet relays: type PMY (RMU), dimensions 24.7 x 38.5 x 41 mm, weight 70 g; type P3 C 10 (RES10), dimensions 11.1 x 16.5 x 26 mm, weight 6 g; and type PKH (RKN), dimensions 25.6 x 56.5 x 97 mm, weight 290 g. Curves are given showing the excess of winding temperature above the ambient temperature as function of the applied power. This plot is obtained experimentally for the RMU-type relay at various temperatures of surrounding air of up

Card 1/4

the Heat Exchange Coefficient of a Relay  
on the Temperature of Surrounding Air

78168  
SOV/103-21-3-14/21

to 141° C. Based on this plot the general expression for the temperature of overheating of relay winding is derived as function of the applied power and of the ambient temperature:

$$\vartheta = a_0 - c\theta_0 + (b_0 - d\theta_0) P. \quad (4)$$

Here,  $P$  and  $\theta_0$  are power and ambient temperature, respectively;  $a_0$ ,  $b_0$ ,  $c$ , and  $d$  are parameters given in curve form. Because of the difficulty of determining the parameters  $a_0$ ,  $b_0$ ,  $c$ , and  $d$  for each type of relay, the winding overheat is determined as a function of various ambient temperatures at a constant value of applied power. Assuming that the initial ambient temperature equals 20° C, the following expression is given for the

Card 2/4

Dependence of the Winding Overheat and  
the Heat Exchange Coefficient of a Relay  
on the Temperature of Surrounding Air

78108

SOV/103-21-3-14/21

overheating temperature  $\vartheta_2$  above the actual  
ambient temperature  $\theta_{o2}$ :

$$\vartheta_2 \approx \vartheta_1 [1 - 0,00198 (\theta_{o2} - 20)]. \quad (7a)$$

where  $\vartheta_1$  is the initial temperature of overheating.  
In order to determine the dependence of the heat  
exchange coefficient of the winding on the  
temperature, a plot of average values of the heat  
exchange coefficient is made as a function of the  
temperature of the winding. Based on this ex-  
perimentally obtained plot and assuming that the  
initial external temperature equals 50° C, the  
following expression for the heat exchange coefficient

Card 3/4

Dependence of the Winding Overheat and  
the Heat Exchange Coefficient of a Relay  
on the Temperature of Surrounding Air

78168  
SOV/103-21-3-14/21

is given:

$$q_2 \approx q_1 [1 + 0,00306 (\theta_2 - 50)]. \quad (13a)$$

where  $q_1$  and  $q_2$  are initial and actual values of  
coefficient, respectively. Two examples illustrate  
the use of the empirical equations given. There

TITLE: Determination of the Heating of Electromagnetic Relay Windings (Opredeleniye nagreva obmotok elektromagnitnykh rele)

PERIODICAL: Avtomatika i telemekhanika, 1998, Vol 19, Nr 11, pp 1036 - 1047 (USSR)

ABSTRACT: In each individual case, the exact value of the mean coefficient of heat dissipation can be determined by experimental means only. It has hitherto been given by the most authors only within the range from  $0.9 \cdot 10^{-3}$  to  $1.4 \cdot 10^{-3}$  W/cm<sup>2</sup>·°C. The results of experiments have shown, however, that in computing the heat values of the mean coefficients of heat dissipation for small-sized relays these values involve great errors and are therefore useless. For small-sized relays this coefficient is of a considerably greater value. To investigate this problem, measurements were carried out on about 100 different electromagnetic relays provided with an exterior rotor armature, as well as on 5 types

Card 1/3

Determination of the Heating of Electromagnetic Relay Windings

SOV/103-10-11-5/10

of such relays of various size, and on 3 large coreless coils. Based on these experiments it is shown that the degree to which the mean coefficient of heat dissipation depends on the cooling surface can be expressed within the limits from  $1 < S_k < 100 \text{ cm}^2$  by formula (5) and in the limits from  $100 < S_k < 5000 \text{ cm}^2$  by formula (6), respectively. Two limiting<sup>k</sup> cases have been investigated. The characteristic curves obtained showed that in computing it is most precise to consider as cooling surface the sum of the cylindrical exterior and interior surfaces of the relay coils.  $S_k$  - cooling surface of the coil in the calculation. The conception of the specific temperature super-elevation of the winding is introduced. This conception characterizes the relay design from the standpoint of heat dissipation. To determine the temperature super-elevation of the winding and the heating time constants as a function of the cooling surface, and the weight and dimensions of the relay, approximate formulae are also given.

Samoletnoye elektrooborudovaniye; sbornik statey, No 1 (Aircraft Electric Equipment; Collection of Articles, No 1). Moscow, Oborongiz, 1960. 106 p. Errata slip inserted. 3,600 copies printed.

General Ed.: A. F. Fedoseyev, Candidate of Technical Sciences; Ed. of Publishing House: K. I. Grigorash; Tech. Ed.: V. P. Rozhin; Managing Ed.: A. S. Zaymovskaya, Engineer.

PURPOSE: This book is intended for engineers engaged in designing and operating aircraft electric equipment. It may also be of interest to those working in the electrical industry, and to teachers, instructors and students in electrical engineering schools of higher and secondary education.

COVERAGE: The book is a collection of 9 articles dealing with problems in designing, calculating and operating aircraft electric equipment, and electric motors, regulators, instruments, etc. The use of heat-resistant coatings and

**PURPOSE:** This book is intended as a guide for all engineering, technical, and planning workers concerned with the packing and shipping of chemical products.

**COVERAGE:** The book discusses the design, manufacture, and utilization of all types of containers for chemical products. It includes technical data of a nature to permit the proper choice of a container in a given situation. New types of containers developed in the Soviet Union, as well as foreign experience, are described. The letter designations for

TITLE: The Main Feature of the Geologic Structure of the Chernigov  
Gravitational Maximum Region ✓

PERIODICAL: Tr. Vses. n.-i. geologorazved. nef. in-t, 1958, No. 12, pp. 140-152 ✓

TEXT: The geophysical research in the last years and deep drilling elucidated the geologic feature of the Chernigov region having a gravitational maximum. A volcanic-sedimentary stratum of 1,160 m thickness occurs above crystalline Pre-Cambrian rocks detected at the 2,747-m depth; this stratum pertains to the Middle and Upper Devonian. The overlying deposits occur above the Devonian system. Magnetic anomalies associated with the gravitation maximum region and reaching 600γ, and, partly, the maximum itself, are caused by the volcanic-sedimentary stratum having the maximum magnetic intensity in the region. The principal gravitation effect is apparently caused by the nonuniform crystalline-base structure and its relief. The author assumes that the Chernigov-maximum-region represents a protrusion of the relatively shallow crystalline-base

Maximum Region

limited in East and West by breaks. This protrusion acted the part of a dam,  
which hampered the connection between the Dnepr-Donets depression central part  
and the Pripyat' graben. However, the Pripyat' graben was directly connected  
with the Dnepr-Donets depression in the course of long periods and appears  
probably to be one of its tectonic elements.

TITLE:

Some Observations on the Article by R.M. Bayevskiy  
"Ballistocardiography and the Possibility of Using  
It in Military Medicine"

PERIODICAL:

Voyenno-Meditsinskiy Zhurnal, 1958, Nr 3, pp 41-42  
(USSR)

ABSTRACT:

The article by R.M. Bayevskiy (Military Medical Journal Nr 5, 1956) touches on the very topical problem of the wide-spread introduction into practice of the methodology of direct ballistocardiography. This methodology is undoubtedly valuable because it supplements our diagnostic potential. Turning to the registration and analysis of ballistocardiography, it should be recalled that fatigue of a patient, a full stomach, or trembling of the extremities, table or floor may produce artefacts which complicate correct analysis of the ballistocardiogram. Therefore it is better to take the ballistocardiogram before the patient has eaten, after 15-30 minutes' rest, on a convenient

Card 1/3

SOV/177-58-3-9/29  
Some Observations on the Article by R.M. Bayevskiy "Ballistocardiography and the Possibility of Using it in Military Medicine"

table, in a warm room, etc. It must be assumed that the method proposed by Bayevskiy of taking the ballistocardiogram in the short period of 1 minute without giving the patient rest may lead to inaccurate recordings and may affect the artefacts. The expediency of recording the ballistocardiogram without removing heavy boots from the patient is also questionable. To save time the author recommends taking ballistocardiograms without electrocardiograms. However, when saving the time needed for attaching electrodes to the extremities, the author will be unable to determine the distances RI, RJ and RK to which he attributes diagnostic significance. The simplified method proposed by Bayevskiy for taking ballistocardiograms, which stems from his desire to save the maximum amount of time, does not give a sufficiently full and accurate record and may mislead doctors and reduce the value of the method of ballistocardiography itself. The ballistocardiograph developed by Bayevskiy essentially differs

Card 2/3

SOV/177-58-3-9/29  
Some Observations on the Article by R.M. Bayevskiy "Ballistocardiography and the Possibility of Using it in Military Medicine"

little from the apparatus recommended by Academician V.V. Parin, V. Dok and Mandelbaum. Their apparatus is also portable, simple, and the data are recorded by means of an electrocardiograph. The support proposed by the author, with its right angles on which the feet are laid, seems to us inconvenient because under the force of gravity the tissue of the extremities will be pressed against the angles of the support, which may cause an involuntary contraction of the muscles. In our opinion, the leg should be supported by a well-stuffed oilcloth cylinder. In practice well-known and well-tested apparatus and methods should be used, while new apparatus can only be proposed for widespread use after thorough testing. ✓

Title : Certain Peculiarities of Atropine Stimulation of the Heart

Orig Pub : Klinich. meditsina, 1957, 35, No 5, 48-50

Abstract : In 50 patients with vegetative disorders of the cardiovascular system, the following changes of EKG. were observed after 1 mg. of atropine was introduced subcutaneously; an increase or a decrease of the pulse rate, galloping alteration of rhythm, change of the atrioventricular rhythm to sinus rhythm, disappearance of ventricular extrasystoles. In one patient, following the injection of atropine, symptoms of coronary insufficiency developed.--F.G. Sivashinskaya

Atropine was injected s. c. in a dose of 1 mg. in 50 patients under the age of 30 yr. with autonomic disturbances of cardiovascular function, and observations (pulse and ECG) were made during the following hour. Slowing of the pulse was observed in most cases, but at different speeds and in different ways. In some cases the frequency increased and in one case an attack of angina pectoris occurred. The use of atropine in cases of functional cardiovascular disturbances can only be based on a strictly individual assessment of the dosage. Vacek - Brno (II, 18)

TITLE: Device for obtaining phonocardiogram envelopes (PKG)

SOURCE: Meditsinskaya promyshlennost' SSSR, no. 9, 1966, 44-47

TOPIC TAGS: phonocardiogram, telemetry, physiology, medical electronics, cardiac physiology, signal envelope, envelope recording, physiological data, *PHONOCARDIOGRAPHY, ELECTRONIC CIRCUIT, DIAGNOSTIC INSTRUMENT*

ABSTRACT: The frequency characteristics of most pen-writing recorder systems ( $\leq 100$  cps) present difficulties in recording phonocardiograms (FKG's), whose high-frequency components are subject to distortion. To avoid these difficulties, the authors propose a phase-rotation device with the following characteristics: 1) from the input signal the circuit forms two output signals with a phase difference of  $90^\circ$  for all frequency components; 2) output phase characteristics are in logarithmic dependence on frequency; 3) amplitude-frequency characteristics are straight and parallel to the frequency axis; 4) working frequency ranges are from 20 to 300 and from 60 to 900 cps; 5) the accuracy of phase rotation is  $\pm 2^\circ$ . This system will record only the geometrical envelope of the PKG signal, which gives full information on the form, amplitude, and duration of sound signals and is sufficient for clinical analysis of PKG's. The idea of using envelopes in medical electronics is not new, and the drawbacks of envelope recording

for low-frequency processes have been described. The authors compared their system against a conventional full-wave detector with equal charge and discharge times in its smoothing filter. It was found that the detector did not give envelopes as good as those obtained with the proposed instrument. Orig. art. has: 3 formulas, 1 circuit diagram, and 2 figures. [DP]

Title : The Study of Nervous Processes in the Course of Subsequent Visual Reactions After Lack of Sleep.

Orig Pub : Zh. Vyssh. nerv. Deyat-sti, 1956, 6, No 2, 212-217

Abstract : The influence of lack of sleep (2-6 hrs sleep) on the subsequent visual reaction (VR) differs depending on the individual variant of VR in sufficient sleep, and reflects the typological peculiarities of the nervous system of the subjects. Four variants are shown in the course of VR: 1) latent period (LP)  $\frac{1}{2}$ -2 sec., duration of VR (DRV) 15-25 sec; 2) LP 3-6 sec., DVR 8-15 sec; 3)  $\frac{1}{2}$ -1 $\frac{1}{2}$  sec, DVR 2-6 sec; 4) LP 3-6 sec., DVR 15-30 sec. In lack of sleep the VR of the 2nd type are the most depressed, a fact which reflects the weak nervous processes with preponderance of inhibition. LP becomes longer, VR shorter (to zero), the strength relations are damaged. A paradoxical phase was

noted in five tests and appeared at a low level, i.e., the VR decreased at all levels of excitation, but in strong excitants the decrease was larger than in weak ones. In the first and fourth types, representing strong nerve processes with some predominance of excitation, the lack of sleep has less influence on the VR. The strength relations are not always disturbed. The paradoxical phase appears at a low level, i.e., to strong irritants the VR decreases, to weak ones it increases. In the third type, (strongly balanced nerve processes), the influence of lack of sleep on VR is insignificant. Caffeine (0.05-0.2 gm) in lack of sleep can have on the VR of the 1st and 2nd type a normalizing as well as depressing influence. The last probable arises from incorrect dosage of caffeine. The basis for the apparent changes in VR in lack of sleep is, according to the author, the lowering of the work capacity of the nerve elements of the visual analyzer.

(primarily cortical as the most reactive ones).  
Under these conditions even the moderately strong visual  
stimuli are sufficient for the development of a limiting  
defense inhibitions.

2986. VITENSON A. S. *Physiological mechanism of the tracing reactions in the sight analyser (Russian text)* Z. vyssh. nerv. dejatel. 1956, 6/2 (218—225) Tables 8

The sight-tracing reactions depend on the functional state of the cerebral cortex. During the increase of the unconditional depression the latent period is prolonged and the tracing reaction diminishes and disappears. On stimulation of the cortex the sight-tracing reactions increase. We may presume that the sight-tracing reaction and the latent period arise as a consequence of the different phases of successive induction; the change of this state depends on the functional state of the cerebral cortex.
