766. CONVERSION RATIO FOR RADIOACTIVE IODINE IN CARDIAC THYROTOXICOSIS - Konversní faktory radioaktivního jodu u kardiálních thyrotoxis - Vohnout S., Röhling S. and Silink K. Vyzkumný úst. Endokrinol., Praha - ČAS. LÉK. ČES. 1958, 97/29 (902-909) Tables i Illus. 18

In 58 individuals with abnormal thyroid function a classification of thyroid dysfunction into 5 groups according to intensity was made on the basis of detailed clinical investigation and long-term follow-up (classification: hypofunction, euthyroidism, mild thyrotoxicosis, moderate and severe thyrotoxicosis) and the relationship of the conversion ratio for  $I^{131}$  to the degree of functional abnormality was tested. It was demonstrated that a high conversion ratio at 24 hr. (over 60%) occurs only in moderate and severe thyrotoxicosis regardless of whether this state was symptomatically slight or marked. A low conversion ratio (less than 60%) was found not only in cases of slight thyrotoxicosis, euthyroids and hypothyroids, but also in several cases of moderate and severe thyrotoxicosis. This method, therefore, cannot be used to differentiate the clinical grade of thyropathy, but is a very valuable aid in the differential diagnosis of cardiac dysfunction.

Voh Novi Stanislav

*M* Accumulation and excretion of iodine-131 in the diagnosis of thyroid disorders. Svatopluk Röhling, Stanislav Voh-pout, K. Hrabová, and Karel Šilink (Ústřední Endokrinol. Ústav, Prague). Časopis Lékařů Českých 94, 1371-4 (1968).—To 8 euthyroid controls, 8 cases with slight oligosymptomatic thyrotoxicosis, 5 with moderately severe thyrotoxicosis, 3 with severe thyrotoxicosis, and 5 with very slight hypothyroidism, a dose of 0.1 mc.  $I^{131}$  (I) was administered orally and the accumulation of I in the thyroid gland was measured *in situ* by Geiger-Müller counting. Urinary excretion of I was also followed. Plots of the results show that the variation of the excretion test leads to overlapping between the various groups of subjects. The accumulation test appears superior; the 24-hr. value is not sufficient for diagnosis, but at least 3 measurements must be made (2, 6, and 24 hrs.).

Title: Products Obtained on Action of Chlorine on Some Silicates. Production  
of Silicon Tetrachloride from Diatomite

Original  
Publication: Studii si cercetari chim., 1955, 3, No 3-4, 195-201

Abstract:  $\text{SiCl}_4$  was obtained by chlorination of diatomite (containing a small amount of  $\text{Fe}_2\text{O}_3$ ) in the presence of coal as a reducing agent. The diatomite being porous has a large contact surface of active silica, which makes possible a ready reduction; the chlorination reaction takes place at a low temperature ( $730\text{--}750^\circ$ ). Bisulfite liquor is used as binder for the raw material. Yield of  $\text{SiCl}_4$  is 46-50%.

H

Abs Jour: Ref Zhur-Khimiya, No 19, 1958, 65207

Abstract: gated, specifies the process of mineralization.  
The eutectic point of this system lies below  $1205^{\circ}$ ,  
while the normal clinker of the system  $\text{CaO}-\text{Al}_2\text{O}_3-$   
 $\text{Fe}_2\text{O}_3-\text{SiO}_2$  forms the liquid phase at  $1338^{\circ}$ . Accord-  
ing to a comparison with  $\text{CaF}_2$ , fluorapatite reduces  
the temperature of the formation of the liquid phase  
by  $40^{\circ}$ . Fluorapatite exerts a stabilizing action  
on  $\beta - 2\text{CaO} \cdot \text{SiO}_2$ , by expanding the zone of its stabil-  
ity to the temperature of the environment. The  
method of cooling the clinker from the mixtures  
mineralized by the fluorapatite has no influence  
on the quality of the cement.

100 AND 5TH COLUMNS  
PROCESSED AND PROPERTIES INDEX  
(4) Effect of small and large amounts of humus on the fixation of nitrogen by *Azotobacter chroococcum* in presence of various substrates, calcium and calcium malate. (5) Influence of humus on heterogenizing oxidation. A slow oxidation and classification processes in humus mixtures. Biochemical action of humus. J. Vasile and H. Luxogiu (Bul. Soc. Chim. Romania, 1930, 12, 71-81, 83-90). (4) Humus affects *A. chroococcum* in two ways: it influences the utilization of energy foods and the rate and degree of nitrogen fixation. Under the same conditions these effects are controlled by the nature of the energy food available. In doses of 5 mg. per 100 c.c. of culture medium, humus accelerates the utilization of sucrose, but retards that of dextrose. In doses of 100 mg. per 100 c.c., humus gives positive but variable effects throughout. So far, it has not been possible to correlate acceleration of fixation with total yields of fixation products.

(5) The effect of adding humus to cultures of *O. pastorianum* and *A. chroococcum* may be compared with that of lowering the oxygen pressure in the culture, with a corresponding reduction of the rate of oxidation. The difficulty of oxidizing humus in the soil, and the slow rate with which its nitrogen becomes available, are considered valuable factors in soil plant-food economy. E. Holmes.

INFLUENCE OF HUMUS ON THE FIXATION OF NITROGEN, AZOTOBACTER CHROOCOCCUM AND CLOSTRIDIUM PASTORIANUM IN IMPURE MIXTURE. CONCLUSIONS CONCERNING THE BIOCHEMICAL ACTION OF HUMUS. Juliu Voicu and Elena Lungulescu. Bul. soc. chim. Roumanie 12, 82-9 (1930).- The action of humus on *Clostridium pastorianum* and *Azotobacter chroococcum* should be considered as the result of the slowing up of the process of oxidation. The effect is similar to that produced by the lowering of the O<sub>2</sub> tension. The N of humus is in a difficultly oxidizable complex and is always available to the plants. The resistance of humus to oxidation is a result of its interference with the activity of ~~microorganisms~~ aerobes.

APPROVED FOR RELEASE: 03/14/2001

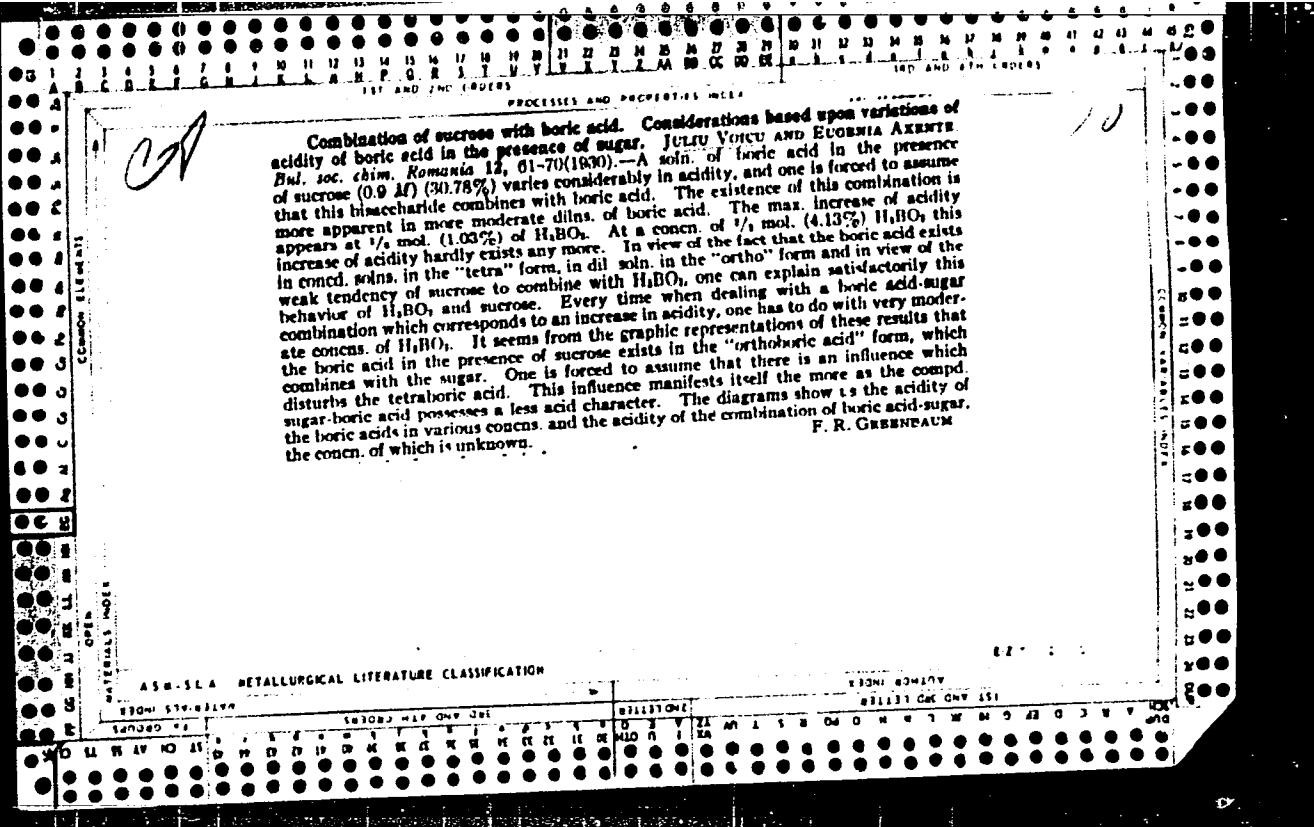

CIA-RDP86-00513R001860410008-3"

Effect of small and large amounts of humus on the fixation of nitrogen by *Anabacter chroococcum* in the presence of different glycides, of manitol and of calcium malate as sources of energy. JULIU VOICU AND ELENA LUNGULASCU. *Biol. soc. chem. România* 12, 71-81 (1930).—THE EFFECT OF HUMUS on the disappearance of the source of energy and the rate of fixation of N in cultures of *Anabacter chroococcum* has been studied. A synthetic culture medium was used. As sources of energy succharose, glucose, dextrose, starch, manitol and Ca malate were added in 5% amounts. Humus was added to the different media in 5 mg. % and 100 mg. %. The humus, prep'd. by a 0.5% NaOH extn. of manure previously extnd. by 1% HCl, contained 4.66% N and 3.4% ash. A small quantity of humus accelerates the disappearance of succharose but retards the disappearance of glucose. The large amt. of humus always accelerates the disappearance of the source of energy and the fixation of N, and increases the yield. The expts. do not confirm the existence of a relation between the acceleration of the disappearance of the source of energy and the fixation of N, and the increase in yield. If such a relation exists, it is limited to a certain period of vegetation and ceas'd. by the compa. of the humus.

AUTHOR: Voicu, O., Popescu, F., and Basarabescu, T.

TITLE: Utilization of Isooctyl Phenol<sup>1</sup> and Dodecyl Phenol as  
Oxidation Inhibitors<sup>1</sup>

PERIODICAL: Petrol și Gaze, 1960, Vol 11, Nr 3, pp 130 - 134

ABSTRACT: The article deals briefly with the study of the  
effect of some anti-oxidating agents on Rumanian  
cracked gasoline<sup>1</sup> and refers to the first studies on  
altered cracked gasoline carried out by Egloff and  
others. O. Voicu and F. Popescu suggested the use  
of long-chain alkyl-phenols, in this case isooctyl  
phenols, isooctyl cresols and dodecyl phenols as  
inhibitors with anti-oxidating effect for ther-  
mally cracked gasoline. For this purpose the  
authors carried out laboratory experiments on the

Utilization of Isooctyl Phenol and Dodecyl Phenol as Oxidation Inhibitors

inhibition of oxygen in gasolines. Gasolines treated with tested inhibitors showed the characteristics given in table 2. Two types of gasolines were used in the test, i.e. 1) STAS 176, type B, engine gasoline with a minimum octane number of 60 and which contained about 30% of cracked gasoline, 2) cracked reformed gasoline of the Dubbs type. Both types of gasoline were produced by the Nr 4 Rafinăria (Refinery) in Cîmpina. By comparing the data in table 3 and results obtained from laboratory experiments, the following conclusions were drawn: 1) Alkyl phenols and alkyl cresols produced by the authors and utilizing higher olefins produced by the Rumanian petroleum industry, can be employed as anti-oxidating additives for cracked gasolines; 2) the introduction of these additives into engine gasolines has the following advantages: a) economy in the refining process, b) octane number is maintained at its initial value
