Title   : Remodeling of the drive of an oil circuit breaker of
                the FS-600 type for automatic reclosure

Periodical   : Energetik, 12, 19-20, D 1955

Abstract   : The author describes the remodeling of an oil circuit
                breaker drive of the FS-600 type, manufactured by the
   Sachsenwerk Plant, for automatic reclosure operation.
                One schematic drawing of the drive.

Denaturation of soya-bean proteins by organic solvents and by heat. E. Volkov and I. Dvinianinova (J. Appl. Chem. Russ., 1940, 13, 287—274).—Denaturation of the proteins during treatment with org. solvents proceeds rapidly during the first 30 min. but only very slowly subsequently. The extent of denaturation rises with increase in temp. of extraction, in water content of the material, and in polarity of the solvent (denaturing effect of benzene or benzine is less than that of acetone, which is less than that of ethyl alcohol).   R. T.

Bacterial nutritive media from hydrolysis products of soybean groats. E. N. Volkov and G. I. Megrelidze. *Trudy Tsentral. Nauch.-Issledovatel. Lab. po Pererabotke Soi, Paluchenie Produktov Fermentatsii Soi i Ikh Ispol'zovanie 1939*, No. 3, 58–63; *Khim. Referat. Zhur. 1940*, No. 8, 33.—Soybean groats were hydrolyzed with HCl

under various conditions, the hydrolyzates were concd. in vacuo at 65–80° and neutralized with soda. The transparency, suitability for the growth of bacteria and the chem. compn. (total amine N, reducing sugars, ash and acidity were detd.) of the soybean exts. obtained and the broth and agar-agar media made from them were equal to those of meat ext., broths and their agar-agar media. Optimum conditions for hydrolyzing soybean groats were: 0.5% HCl, pressure 15 atm., temp. 130°, time 4 hrs., soybean ext. added to the medium 2%, and pH for clarifying the ext. with egg white 5.8–6.8. Soya-bean casein for plastic mass production. B. T. Yegorov and P. G. Gascoyne (From. Org. Chim., 1934, 9, 18—19).—Plastics are obtained by ... pts. of a mixture of soya-bean casein ... CaO ... active ... stearic acid ... stearate ... and ... 205 pts. with 17·5 pts. of a mixture of hexamethylenetetramine 34·4, (CH₂)₆N₄; 2·3 pts., stearic acid ... and Zn stearate 0·05 pt.   R. T.

Denaturation of soybean proteins by organic solvents and heat. K. N. Volkov and I. I. Dymshakova. *J. Applied Chem.* (U. S. S. R.) 13, 267-71 (in German, 273-4) (1940). Treatment of soybeans with gasoline and alc. caused the denaturation of protein in 30 min. Treatment for 3.5 hrs. did not visibly affect the degree of denaturation. The denaturation action of the solvents is greatest for the solvent of highest dielec. const. Heat increases the denaturing effect of alc., but has little effect on that of acetone. In all cases, the greatest degree of denaturation is effected in the protein contg. the most moisture. Therefore, to protect protein from denaturation, soybean material should be dry and the temp. not over 181°.   A. A. Podgorny

Albuminous plastics from soybean press cake. E. S. Volkov, P. G. Grigor'ev and V. Gulyaev. *Org. Chem. Ind.* (U.S.S.R.) 6, 517-18 (1939); cf. C. A. 33, 8838.— The inferior qualities (discoloration, swelling and permeability to water) of pressed articles from soybean casein and rosinol were traced to the presence of decompn. products of albumins. The phys. and mech. properties of the moldings can be greatly improved by the use of casein or press cake freed from the decompn. products by preliminary washing with dil. NaOH and neutral zinc with 4% HCl.   Chas. Blanc

The interaction between soy glycinin and formaldehyde. E. N. Volkov, P. G. Grigor'ev and O. A. Rezvetsov. *J. Applied Chem.* (U. S. S. R.) 14, 416–18(1941).—The globulin-glycinin fibers of the soy bean were fixed by treatment with 2½%, 4% and 0.5% soln. of formaldehyde. The beans were extd. with gasoline b. 78–80°, the gasoline was removed *in vacuo*, the degreased seeds were ground to fine powder and digested with 20 vols. of a 0.2% soln. of KOH, let stand for 18–20 hrs., the soln. was decanted and albumin was coagulated with 4% HCl at the isoelec. point (pH = 4.5 – 4.6). The pptd. glycinin was washed with tepid water till free of Cl ions. On treatment with formaldehyde, the amount of glycinin fixed increases with the concn. of formaldehyde and with the duration of treatment. The equil. between formaldehyde and glycinin is reached in all cases after 48 hrs. 6 references.

Interaction of soya-glycinin and formaldehyde. E. N. Volkov, P. G. Grigoriev, and O. A. Rozvetaov (*J. Appl. Chem. Russ.*, 1961, 14, 416—418).—Interaction of soya-glycinin (I) and CH_2O was investigated for $[CH_2O]$ 0-5—22%, and for 30 min. to 90 days, the reaction being followed by determination of CH_2O not bound to (I). Increase in $[CH_2O]$ or a longer time of reaction increased the quantity of CH_2O bound to 1 g. of (I). Equilibrium between (I) and CH_2O was almost reached after 48 hr. contact at all the three concns. of CH_2O used.   N. G.

The character of the hydrolysis of protein and carbohydrate substances in soybean fermentation. K. N. Volkov and O. A. Rezvetsov. *Trudy Tsentral. Nauch.-Issledovatel. Lab. Pererabotke Soi, Poluchenie Produktov Fermentatsii i ikh Ispol'zovanie* 1939, No. 3, 18–22; *Khim. Referat. Zhur.* 1940, No. 8, 130.—The ripening of soy sauce under the influence of *Aspergillus oryzae* is a typical biochem. process. Polypeptides and amino acids are formed from proteins under the influence of proteolytic enzymes. Diastatic enzymes decomp. the carbohydrate substances into disaccharides and monosaccharides. The monosaccharides are transformed into alc. and org. acids,

mainly into AcOH and lactic acid. The presence of these substances proves the presence of other enzymes.

Stability of sodium glycinin sols. E. Volkov and I. Dvinjaninova
U. *Appl. Chem. Russ.*, 1961, **14,** 854—858).—The stability of 10%
and 12% Na glycinin (I) sols on ageing at room temp. in the presence
of 1·0—30·0% NaOH (calc. as % of the protein present) was in-
vestigated by measuring their surface tension (γ). γ decreases with
increasing [NaOH]. 10% (I) sols are unstable at all [NaOH]
investigated, the sols separating into two phases. The 12% sols
are stable over the range 4·5—6·0% NaOH (calc. on the protein):
below 4·5% NaOH, the sols tend to change to gels, whilst above
6·0% NaOH separation into two phases occurs at a rate which
increases with increasing [NaOH].   N. G.

TITLE: Magnetic flaw detector. Class 42, No. 180391

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 7, 1966, 73

TOPIC TAGS: flaw detection, magnetic amplifier, magnetic method

ABSTRACT: This Author Certificate presents a magnetic flaw detector containing
a power transformer, electromagnets, a capacitor, and rectifiers through which
pulsed discharge of the capacitor is produced, and an automatic circuit con-
trolling the rectifier triggering. Longitudinal magnetization in the automatic
circuit is produced by electromagnets, and circular magnetization—by the gating
of the pulsed current. To check parts of any size or form with subsequent total
demagnetization, the controlled rectifiers are in the form of opposing controlled
semiconductor diodes and are connected in the transformer primary and secondary
circuits. The control electrodes of the primary diodes are connected to the
UDC: 620.179.141.1/.2

0

capacitor discharge circuit. The control electrodes of the secondary diodes are connected to the automatic circuit. To establish the required strength of the magnetization current and the reversing frequency of the demagnetization current, the automatic circuit contains magnetic amplifiers whose outputs are connected to the control electrodes of the transformer secondary, and the input windings—with a potentiometer.

TITLE: The Application of Cyclone Stokers With Liquid Slag
                Removal for Firing Cut Peat (O primeneniyem tsiklon-
                ynykh topok s zhidkim shlakoudaleniyem dlya szhiga-
                niya frezernogo torfa)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Energetika,
                1959, Nr 2, pp 79-86 (USSR)

ABSTRACT: Since about 50% of the coal required by the economic
                districts of the Ural, including the Sverdlovsk,
                Perm' and Chelyabinsk Oblast', are mined in Karagan-
                da, Kuznetsk, Ekibastuz, Cheremkhovo and Khakasiya,
                the authors recommend exploiting the local peat
                deposits as a boiler fuel. In the past, many methods
                for using peat as a boiler fuel have been tried, but
                these experiments failed, since an economic and
                stable firing of peat could not be achieved. Only
                the pneumatic stokers of TsKTI, which were based on
Card 1/6   the whirl principle of A.A. Shershnev, had some

SOV/143-59-2-10/19

The Application of Cyclone Stokers With Liquid Slag Removal for
· Firing Cut Peat

success and together with the shaft-mill method, they
found the most wide-spread application. The cyclone
stokers, suggested by Professor G.F. Knorre, are the
latest development in this field. The shaft-mill
method has a heat liberation value of $150 \cdot 10^3$ kcal/
m^3 h, while that of the TsKTI stoker is $120 \cdot 10^3$ kcal/
m^3 h, which is relatively low and therefore large
stoker volumes are required. In addition, soot traps
must be installed, since about 85% of the peat ash
are carried out of the smokestacks with the first
method and almost 100% with the TsKTI stoker. The
large stoker volumes and the soot traps of the pre-
sently used methods are not suitable for a large-
scale conversion of boiler stokers to use peat as
fuel. Therefore, only 2.09 million tons of peat
were mined in the Sverdlovsk Oblast', in 1957, while
the annual output could be around 40-50 million
tons annually, since the peat deposits in this area
alone are estimated at 4.5 billion tons. The Ural

Card 2/6

SOV/143-59-2-10/19

The Application of Cyclone Stokers With Liquid Slag Removal for Firing Cut Peat

peat is composed of small particles, those having a size of 3-4 mm amount to only 10-15% and its ash content is 8.9-9%. The melting point of the ash varies between 1050 and 1170°C. The moisture content changes annually; in 1956 it was 46.3%, while it decreased in 1957 to 42%. Mining one ton of peat costs presently 16-18 rubles, but this cost could be reduced with large-scale mining methods. For using peat as boiler fuel on a large scale, the authors recommend a cyclone stoker with liquid slag removal. However, there are no publications available on data for firing peat in cylone stokers. According to data furnished by M.A. Nadzharov /Ref 5/ for coal-fueled cyclone stokers, the slag viscosity must not exceed 250 poise at 1400°C. Calculations showed that with a 50% moisture content of the peat, temperatures of only 1400-1500°C could be obtained at the outlet of the cyclone stoker, even if hot air of 400° C was blown in, while theoretically 1640°C were re-

Card 3/6

SOV/143-59-2-10/19

The Application of Cyclone Stokers With Liquid Slag Removal for
Firing Cut Peat

quired. The authors had the opinion that such a
temperature would not provide a stable and continous
removal of the liquid slag. When burning peat in a
cyclone stoker with liquid slag removal, the main
problem is to provide a temperature in the combustion
chamber which exceeds the melting temperature of the
slag to a considerable degree. The authors perform-
ed the same calculations for peat with a moisture
content of 30-35% which showed that a temperature
of 1706-1733°C could be achieved when blowing in
air at 350-400°C. Figure 1 shows the graphical pre-
sentation of the calculation results. A footnote
says that the slag viscosities of various fuels are
under investigation at UPI - Ural'skiy politekhni-
cheskiy institut imeni S.M. Kirova (Ural Polytech-
nical Institute imeni S.M. Kirov). Based on the
theoretical calculations an experimental cyclone
stoker was built at UPI, as shown by figure 2. A

Card 4/6   fan was used, powered by a 50 kw asynchronous motor,

SOV/143-59-2-10/19

The Application of Cyclone Stokers With Liquid Slag Removal for
Firing Cut Peat

which produced a pressure of 2,000 mm water column
at 3,000 m^3/h air consumption. The air heater pro-
vided temperatures of up to 500°C. The combustion
chamber of the cyclone stoker is shown by figure 3.
The peat used for the experiments was preliminarily
dried and had a moisture content of 15-20%, its ash
content was 11% with 62-69% volatile matter. Its
heat value was 3900-4100 kcal/kg. The peat was fed
into the cyclone stoker at a rate of 450 kg/h at an
air temperature of 350°C, whereby heat liberation
values Q/V_{ts} = 9·10^6 kcal/m^3h and Q/F_{ts} = 7.5·10^6
kcal/m^3h were obtained. The gas temperatures in
the cyclone stoker were 1500-1600°C while the surface
temperature of the liquid slag flowing out of the
tap hole was 1380-1440°C. Pyrometer errors must be
taken into consideration, thus the actual temperatures
were somewhat higher. Based on the positive results
of the experiment, the Kafedra PTE - Kafedra promtep-

PURPOSE: This book is intended for personnel of scientific research institutes and industrial engineers in the field of applied fluid mechanics, and may be of interest to students of advanced courses in the field.

Transactions of the Conference (Cont.)   SOV/5290

COVERAGE: The book consists of the transcriptions of 31 papers read at the conference on gas dynamics which was convened under the initiative of the Kazakhskiy gosudarstvennyy universitet imeni S.M. Kirova (Kazakh State University) and the Institut energetiki Akademii nauk Kazakhskaya SSR (Institute of Power Engineering of the Academy of Sciences Kazakhskaya SSR) and held October 23-26, 1956. Three branches of applied gas dynamics were discussed, namely: jet flow of liquids and gases, aerodynamics of furnace processes, and the outflow of liquids. The practical significance of the Transactions of the conference consists in the elaboration of theory to methods of technical computation and measuring methods related to industrial furnaces and other industrial processes in which aerodynamic phenomena play a predominant role. Eight papers read at the Conference are not included in this collection for various reasons. The authors of the missing papers are: L.D. L'vov (Thermal and Aerodynamic Characteristics of Pulverized Coal Place Burners) and A.A. Colpersky (Outlines and Physical Models of the Jet Motion Mechanics of Fluids), Z.I. Antonov, Ye. P. Bogdanov, S.V. Bukhman, T.K. Khronenko, A.B. Rezryakov, and G.V. Yakubov. L.G. Loviyarskiy is mentioned as being in charge of a department of the Kazakh State University, Docent, and I.D. Malyukov, Candidate of Physical and Mathematical Science, at the end of at a member of the same university. References are found at the end of

AUTHOR: Volkov, Ye. V.

TITLE: Rotational Motion of a Gas in the Zone of a Cyclone Chamber
               Near Its Axis

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1960, Vol. 3. No. 8,
               pp. 26 - 30

TEXT: In studying the rotational component of the velocity of an iso-
thermal flow in the zone near the axis, the author assumed the flow in
this zone to be helical. The equation of Gromek for the helical flow of a
viscous incompressible liquid which contains no dissipation terms is
written down as follows: $\varrho \frac{\partial \vec{w}}{\partial t} + \text{grad } \vec{H} = -\mu \text{ curl } \vec{\omega}$ (1) ($\vec{w}$ vector of the
averaged velocity, $\vec{H}$ vector of the total energy). In his studies, the
author deals only with the steady flow, and shows that the Laplace
equation holds for the averaged vorticity vector $\vec{\omega}$. The author obtains the
following solution by means of a Fourier expansion:

Card 1/2

85628

Rotational Motion of a Gas in the Zone of a   S/170/60/003/008/015/019/XX
Cyclone Chamber Near Its Axis   B019/B067

$$\frac{\omega}{\omega_T} = 1 - I_0(2.4\frac{r}{r_\varphi})\frac{sh\left(2.4\ \frac{z}{r_\varphi}\right)}{sh\left(2.4\ \frac{z_0}{r_\varphi}\right)}$$ (12). Here, ω_T is defined by boundary

conditions established on the basis of experimental data. (12) is the
solution of the Laplace equation satisfying the boundary conditions. It
describes the distribution of angular velocity in the cyclone chamber.
Other authors determined $W_\varphi = \omega r$ experimentally (Ref. 2). As is proved
by the diagrams shown in Figs. 2 and 3, these values are in good agree-
ment with the curves calculated by the author. With these results, also
the interactions between the flow near the axis and the peripheral flow
can be studied. There are 3 figures and 4 Soviet references.

AUTHOR: Volkov, Ye.V., Engineer

TITLE: The Rotation of an Isothermal Flow of Gas in a Cyclone Chamber

PERIODICAL: Teploenergetika, 1960, Nr 8, pp 32-37 (USSR)

ABSTRACT: Earlier experimental work published in Teploenergetika, 1954, Nr 9, established the main qualitative relationships of the isothermal flow of gas in cyclone chambers and also gave quantitative relationships for some aspects of cyclone flow. However, theoretical consideration of the problem is made difficult by the great complexity of aerodynamic processes in cyclones. Indeed, some features of cyclone flow structure have not yet been explained qualitatively. Accordingly, it is desirable first to study individual typical features of this complex process and subsequently to analyse the process as a whole. Experiments showed that two characteristic zones may be distinguished in the distribution of the rotational component of the velocity over the radius of the cyclone: a peripheral region where this component increases towards the centre and an axial region where

Card 1/5

81810
S/096/6C, vOC/08/007/024
E194/E484

The Rotation of an Isothermal Flow of Gas in a Cyclone Chamber

it diminishes towards the centre. By analogy with
the rotation of a liquid the peripheral zone is often
called the quasi-potential rotation zone and the axial
zone the quasi-solid rotation zone. The present work
mainly concerns the axial zone and it should accordingly
be mentioned that in theoretical hydromechanics, the law
of quasi-solid rotation of liquids is derived from
analysis of laminar rotary motion or else is introduced
to complete the mathematical descriptions of plane
rotation of the liquid. The results derived on this
formal basis may be very different from experimental data.
A typical feature of the isothermal flow in cyclone
chambers is the presence of an axial return flow of gas
which commences outside the chamber and penetrates to the
back wall of the cyclone. As this return flow penetrates
into the cyclone chamber the distribution of the
rotational component of the velocity is seriously affected.
In other words, the rotational component should be
considered as a function of two variables, the radius and
the distance from the back of the cyclone. Accordingly,

Card 2/5

81810
S/096/60/000/08,)07/024
E194/E484

The Rotation of an Isothermal Flow of Gas in a Cyclone Chamber

the development of rotary motion in the axial zone may be represented by the diagrams given in Fig 1 where section 1 is near to the discharge section of the cyclone and the only layer of gas with considerable rotary motion is that near the discharge vortex. The layer of gas near the axial return flow swirls either little or not at all. As the return flow penetrates into the chamber its inner layers commence to swirl and this swirling motion increases until the back of the chamber is reached. This effect has previously been explained by the transfer of angular momentum from the outer layers of gas to the air but the explanation is unsatisfactory in some respects and modifications are suggested. The limiting rotational velocity distribution in a turbulent flow of gas is an interesting theoretical problem, which cannot be considered here, particularly as the limiting distribution appears not to be set up in the relatively short cyclone chamber models tested. Formulae are derived for the distribution of the rotary component of motion in the axial zone of the cyclone

Card 3/5

81810

S/096/60/000/08/007/024
E194/E484

The Rotation of an Isothermal Flow of Gas in a Cyclone Chamber

chamber starting from hydrodynamic equations of an
incompressible viscous liquid in the form given by
Reynolds, see Eq (1). The methods of vector calculus
are applied to obtain this expression in the form of
Eq (5a) and the boundary conditions are given by Eq (8).
Eq (5a) is then solved by the Fourier method and an
integral is obtained in the form of a Bessel function.
A general solution of Eq (5a) is then obtained in the
form of Eq (17). Certain simplifications are then made
which are expressed by Eq (18) so that Eq (17) is
converted to the form of Eq (19). Finally, an expression
for calculating the relative angular velocity is obtained
in the form of expression (20) which is a solution of
Eq (5) and satisfies the boundary conditions (6). This
equation describes the distribution of angular velocity
over the length and radius of the axial zone of the
cyclone chamber and thus reflects the process of
developing swirl of the neighbouring masses of gas.
Calculated curves of the distribution of relative angular
velocities in the axial zone of the cyclone chamber are

Card 4/5

81810

S/096/60/000/08/007/024
E194/E484

The Rotation of an Isothermal Flow of Gas in a Cyclone Chamber

plotted in Fig 2. The theoretical curves are then
compared with the experimental results published in
Teploenergetika, 1954, Nr 9, see Fig 3.   It will be seen
that, in general, agreement between theory and practice
is very satisfactory and an explanation is offered for
the differences that are observed. This good agreement
indicates that although the mathematical approach adopted
is as yet without theoretical foundation it nevertheless
appears to be acceptable. Eq (17) and (20), in addition to
giving the velocity distribution at any section of the
axial zone of the cyclone chamber also affords the
possibility of explaining a number of special features in
the distribution of static and total heads in this zone.
The equations may also be used to analyse the interaction
between the flows in the axial and peripheral zones. There
are 4 figures and 6 Soviet references.

PURPOSE: This book should be of interest to scientists and engineers working on problems of applied gas dynamics and may be of use to students.

COVERAGE: This book presents reports and brief summaries of the discussions which took place at the Conference on Applied Gas Dynamics in Alma-Ata in October 1959. The conference was subdivided into three areas of applied gas dynamics: jet flows of fluids and gases, the aerodynamics of heating processes, and the discharge of a fluid. The practical value of the "Transactions of the Conference" consists in the development of theory, methods of technical calculation and methods for systematic measurement applied to heating, furnace, and other industrial processes for which, in most cases, aerodynamic phenomena are decisive factors.

TITLE: Existence of a Convex Polyhedron Realizing a Given
       Polyhedral Metric. I

PERIODICAL: Vestnik Leningradskogo universiteta, Seriya matematiki,
            mekhaniki i astronomii, 1960, Vol. 19, No.4, pp.75-86

TEXT: The author uses the terminology of (Ref.1). He gives a new
proof of the theorem:

Let R be a domain homoemorphic to a disk on a manifold with a
polyhedral metric of nonnegative curvature and let the boundary
L of R have everywhere nonnegative swerve towards R; then R is
isometric to a convex cap.

The proof is based on the following idea from (Ref.4): In order to
construct a closed convex surface with a differential-geometric
metric prescribed on a spherical surface, it is sufficient to
continue this metric from the spherical surface into the interior
of the sphere so that the sphere is transformed into a manifold
which is isometric to a convex body of the Euclidean space. In order
to realize this idea the author uses polyhedra according to A. D.

TITLE: Theorems of Uniqueness for Surfaces in the Large. IV (Teoremy
             yedinstvennosti dlya poverkhnostey"v tselom. IV)

PERIODICAL: Vestnik Leningradskogo universiteta, Seriya matematiki,
             mekhaniki i astronomii, 1958, Nr 13(3), pp 27-34 (USSR)

ABSTRACT: The paper contains a detailed representation of the results
             partially announced in [Ref 1]. The theorems and their proofs
             correspond to those ones of [Ref 3] . In contradistinction to
             [Ref 3] only Euclidean spaces are considered where the principal
             curvatures are understood in the sense of the relative differential
             geometry. The analogy to the results of [Ref 3] is considerable
             so that the author points to [Ref 3] because of the numerous
             conclusions. One of the conclusions contains a result of Süss
             [Ref 4] .
             There are 4 references, 3 of which are Soviet and 1 German.

"Practical Videoamplifier Circuits on Junction Transistors,"
by T. M. Agakhanyan and Yu. A. Volkov, Radiotekhnika, No 11,
Nov 56, pp 38-44

Practical videoamplifier circuits on junction transistors of the
PlYe, PlI, and PlZh types were built with the purpose of decreasing the
distortions of the pulse fronts.

Calculations and experimental data demonstrated that significant
widening of the pass-band of the amplifiers on crystal transistors was
possible by circuit methods.

For the three types of junction transistors mentioned above, the
possibility was demonstrated of building videoamplifiers with a tran-
sition characteristic build-up time of from 0.1 to one microsecond while
the amplification factor varied from 3 to 1,000.

In the present work practical schemes of wideo-amplifiers in which the new dis-
tribution of the current carriers is carried out by means of complete back-
coupling, are described. At first schemes for a one-cascade amplifier are shown.
The chain of back coupling serving the purpose of diminishing distortions on
the impulse fronts in all cases leads to an increase of the temperature stabil-
ity of the scheme. In those cases in which this becomes necessary an additional
temperature compensation may be provided. Backcoupling makes it possible to re-
duce the time of the increase of the transition characteristic of the cascade
considerably. Various oscillograms of the output voltage of the cascade with
backcoupling in the critical and in the oscillating state are mentioned. The
time of the increase of the cascade with backcoupling can be computed according
to the formulae mentioned in the authors'work in Radiotechnika, 11, fasc.9
(1956). By means of the complex backcoupling it is possible to extend the trans-
mission width of the amplifier to the value which exceeds the frequency limit.
In an example mentioned here the utmost frequency limit is nearly double the
frequency limit of the coefficient of the current amplification of the triode.
It is then possible, by means of the complex backcoupling, to improve the im-
pulse front, and besides, backcoupling improves a number of other characteris-

Radiotechnika, 11, fasc. 11, 38-44 (1956) CARD 2 / 3   PA - 1709

tics of the amplifier: Increase of input resistance, increase of stability, reduction of nonlinear distortions, and, consequently, also an increase of the permitted value of the output voltage etc. As the amplification coefficient is usually given, the application of the scheme with complex backcoupling entails the necessity of increasing the number of cascades of the amplifier. Some multi-cascade amplifiers are then described. In this connection the number of cascades and their parameters (type of triode, degree of backcoupling, etc.) which warrant the least possible impulse distortion must be selected. A formula is given according to which it is possible to compute the coefficients of amplification according to voltage for average frequencies. The time of the increase of the transition characteristic of the cascades is reduced with a decrease of backcoupling. However, in the case of low backcoupling a large number of cascades is necessary in order to attain the given amplification. In the case of a given amplification and number of cascades the degree of the backcoupling need not necessarily be the same in all cases. It is advisable to apply a lower degree of backcoupling in the case of the first cascade. The scheme of a two-cascade amplifier and its characteristic are described in form of a diagram. Besides, the oscillograms of the output voltage of the amplifier are shown. - Computations and experiments show that a condiserable broadening of the transmission band of the amplifier is possible on crystalline triodes with the help of this scheme.

Radiotechnika, 11, fasc. 11, 38-44 (1956) CARD 3 / 3   PA - 1709

On flat triodes of home production wideo-amplifiers in which the time needed
for the increase of the transition characteristic is from 0,1 to 1 μF, can be
constructed with a corresponding amplification coefficient of from 3 to 1000.
It may be assumed that in future crystalline triodes in large impulse schemes
will become a serious competition of electron tubes.

TITLE: Bounds for the Difference of Solutions of the Equation $f(z_1,\ldots,z_n)$ det $\| z_{ij} \|$ = $h(x_1,\ldots,x_n)$ in Terms of Difference of the Right Side of the Equation

TEXT: Let $x = (x_1,\ldots, x_n)$, $\zeta = (z_1,\ldots,z_n)$, $z_i = \dfrac{\partial z}{\partial x_i}$, $z_{ij} = \dfrac{\partial^2 z}{\partial x_i \partial x_j}$,

$z = z(x_1,\ldots, x_n)$. Let $h(x) \geq 0$ be defined in a convex domain D of the space of the x ; let $f(\zeta)$ be defined for all ζ , summable on every closed bounded measurable set, and let $m = \inf\limits_{\zeta} f(\zeta)$.

Theorem 1 : Let $z^0(x)$ and $z^1(x)$ be convex solutions of the equation

(1) $f(z_1,\ldots, z_n)$ det $\| z_{ij} \|$ = $h(x_1,\ldots, x_n)$

Card 1/3

Volkov, Yu. A. On deformations of a convex polyhedral angle. Uspehi Mat. Nauk (N.S.) 11 (1956), no. 5(71), 209–210. (Russian)

Pogorelov, A. V. A new proof of rigidity of convex polyhedra. Uspehi Mat. Nauk (N.S.) 11 (1956), no. 5(71), 207–208. (Russian)

The first paper establishes: Let V, V' be two convex polyhedral angles of more than two faces, which, in the same cyclical order, are pairwise congruent. If e_i, e_i' ($i = 1, \cdots, n > 2$) are the unit vectors from the vertices of V, V' along corresponding edges and θ_i, θ_i' are the dihedral angles of V, V' respectively at e_i, e_i' ($\theta_i = \pi$ or $\theta_i' = \pi$ admitted), then the vector $\sum (\theta_i' - \theta_i) e_i$ is different from 0 and points into the spherical image of V unless V and V' are congruent.

The second paper deduces very simply from this result the following general form of Cauchy's theorem. Two intrinsically isometric convex polyhedra in E^3 are congruent as sets in E^3.   *H. Busemann.*

VOLKOV, A.   Yu. A.

Effect of shot blasting on repeated-impact resistance. N. A. Anuchin and Yu. A. Volkov. *Vestnik Mashinostroeniya* 34, No. 8, 55-8(1951). Notched Mesnager specimens of C 0.10, Cr 0.72, Ni 1.67, Mo 0.22%, and of plain-C steels 0.55% were shot-blasted on the notched side with 1-1.5 mm. chilled iron shot and tested to destruction by repeated impacts ranging between 10.2 and 24.7 kg./sq. cm. The life of samples increased 1.5-3.5 times by the treatment, the alloy steel responding more pronouncedly. Higher impact loads lower, however, both the abs. and relative strength increase caused by shot blasting. The strength increases in this case during the first 2-2.5 min. of blasting and then decreases. Heating destroys the strengthening effect when above 150°.

TITLE: Direct measurements of some characteristics of atmospheric turbulence above water

SOURCE: Ref. zh. Geofizika, Abs. 12V71

REF SOURCE: Sb. 2-y Mezhdunar. okeanogr. kongress, 1966. Tezisy dokl. M., Nauka, 1966, 172-173

TOPIC TAGS: atmospheric turbulence, wind velocity, atmospheric temperature, wind profile, ocean dynamics / Black Sea, Mediterranean Sea

ABSTRACT: The results of investigations carried out aboard the ship "Ak. Vavilov" in the Black and Mediterranean Seas in 1964 and 1965 are presented. Equipment from the Institute of Physics of the Atmosphere, previously used for studies on turbulence structure and temperature above a solid underlying surface, was used for measurements and statistical processing of wind velocity pulsations and temperature. The pickups of the devices were located on a floating

Card 1/3   UDC: 551.465.15.

ACC NR: AR7004095

spar buoy at a distance of 50 m from the ship. An acoustic anemometer made it possible to measure the pulsations of the horizontal and vertical wind velocity components, u' and w'; a microthermometer measured temperature pulsation, T'. For all the devices the time constant was of the order of 0.01 sec. The following atmospheric turbulence characteristics were calculated using special electronic equipment: 1) pulsation dispersions $\sigma_u = \sqrt{\overline{u'^2}}$, $\sigma_v = \sqrt{\overline{w'^2}}$, $\sigma_T = \sqrt{\overline{T'^2}}$; 2) vertical heat flows and motion quantities $Q = C_p \rho \overline{W'T'}$, $\tau = -\rho\overline{u'w'}$. ; 3) pulsation energy distribution along the spectrum of wave numbers F_u, (k), F_w, (k), and F_T, (k); 4) mean wind velocity profiles $\bar{u}(z)$ and some mean temperature profiles $\bar{T}(z)$. Measurements of all pulsation characteristics were usually made at an altitude of two above the calm sea surface level, or, in some cases at a 1-m level. The members of the Institute of Oceanology, Academy of Sciences, made measurements of spectral composition and sea intensity along with the atmospheric measurements. From the data obtained, relationships between pulsation characteristics and the averaged characteristics of temperature and wind fields above the agitated sea surface were obtained. In particular, the relationship between the friction rate, $v_* = (\tau/\rho)^{\frac{1}{2}}$,

and the mean wind velocity, $\bar{u}(z)$, was established. The value of v_*, calculat-
