TITLE: One way of calculating head waves associated with curvilinear interfaces

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 9, 1962, 28, abstract 9A187 (Geologiya i geofizika, no. 1, 1962, 135-143)

TEXT: The range of applicability of the approximate method suggested by S. A. Fedotov (RZhGeofiz, no. 2, 1958, 954) for calculating the intensity of head waves, formed at a curvilinear interface, is discussed. The method is based on the use of the radial method's formulas, derived for head waves in the case of flat boundaries, the divergence arising at the expense of the boundary's curvature being additionally taken into account. The length of the head wave ray resting on the boundary is replaced by that of the corresponding section of the curved boundary. It is pointed out that the method is inapplicable, when there are corner points at the bound-

dary, and also in the loops of hodographs in the case of unsolved seismograms. Examples of the calculation of the focussing effects for boundaries are quoted, these being composed of horizontal straight lines and circular arcs. The results of calculating Fedotov's wave divergence are compared. This author proposes that use should be made of the graphical determination of the relations of sections of radial tubes of finite width to the "precise" radial calculation, based on the direct computation of the boundary curvature radius. The difference in the results of the two methods of calculation is appraised. In the authors' opinion this appraisal defines the error of Fedotov's method. TITLE: Frequency distortions of seismic signal in a three-component seismic bore hole detector

SOURCE: Geologiya i geofizika, no. 3, 1964, 154-156

TOPIC TAGS: seismic survey, seismic signal, signal frequency, frequency distortion, seismic receiver, well surveying, seismic detector SES 3

ABSTRACT: Three different methods for instrument arrangement in a well were studied to determine their effect on the frequency distortions of seismic signals. Such distortions are caused by movements of the instrument during the registration process. The asymmetrical installation of the well-surveying apparatus shown in Fig. 1 of the Enclosures produced the best results. In this case distortions in the direction of the X-axis occurred at frequencies which were not met in the usual frequency interval of a seismic survey. It was assumed that signal distortions were caused by the rotary vibration of the apparatus with respect to the line of contact between the instrument frame and the wall of the well. From this standpoint it seemed more advantageous to place the horizontal detectors eccentrically with

Card 1/83

ACCESSION NR: AP4039379

respect to the X-axis (that of the compressive force direction). It was proved experimentally that the system shown in Fig. 1 vibrated with one degree of clearance under the action of an impulse force. The analysis of such vibrations was made by A. A. Yablonskiy and S. S. Noreyko (Kurs teorii koblebaniy. "Vys'shaya shkola", 1961). A more detailed study of the seismic record distortions was made during the laboratory testing of the three-component seismic detector SES-3 under stationary conditions. Three different ways of instrument arrangement in the well (see Fig. 2 of the Enclosures) were studied at different strengths of the spring compression. The frequency characteristics of the spring device in this instrument are also shown in Fig. 2. Here curves 1 and 2 indicate the readings of the vertical and the horizontal detectors (oriented along the stress direction). Curves 3, 4, 5, and 6 correspond to the detector oriented perpendicular to the compression axis for the following cases: 3 - the instrument was pressed with its two rigid supports against the well wall; the supports checked its motion in the horizontal plane (Fig. 3b); 4 - the instrument was fixed with one spring only (Fig. 3d); 5 - the instrument is pressed with two strong springs; 6 - the compressive strength was increased five times. According to the results obtained the arrangement (3b) eliminated the resonance distortion, though some distortion still remained at the frequencies (10-30 cps), presumably caused by insufficient rigidity of the instrument in its

TITLE: Constructing a standard scheme for geological interpretation of geophysical data

SOURCE: AN ESSR. Doklady, v. 171, no. 1, 1966, 170-172

TOPIC TAGS: geology, geophysics, probability, algorithm, set theory

ABSTRACT: A scheme for geological interpretation of geophysical data is described. Let A be a set of objects, and let U and V be systems of criteria (one-place predicates) defined in A. It is assumed that a' and a'' ∈ A are indistinguishable by U if for $\forall u_i \in U$ we have $u_i(a') + u_i(a'') \neq 1$. The indistinguishability relation is the equivalence relation and ensures representation of A as $A_1, A_2, \dots, A_{N(U)}, A_i \cap A_j, i \neq j, \dots$. Any other division that can be obtained from $\overline{A:U}$ by uniting its classes will be called a derivative and denoted by $\{[A:U]\}$. $\{[A:U]\}$ will diagonalize $\{[A:V]\}$ if

$$-\sum_{j=1}^{N'} p_j \log p_j > -\sum_{i=1}^N p_i \left(\sum_{j=1}^{N'} p_{ij} \log p_{ij} \right)$$

UDC: 550.30+550

Card 1/2

ACC NR: AP6036763

where p_j' is the probability of events $a \in A_j'$; p_i is the probability of events $a \in A_i$; and p_{ij} is the probability of events $a \in A_j'$. When this latter condition is fulfilled, then Bayes' criterion can be used to show that a scheme that permits determination of the membership of a in A_j' on the basis of the membership of a in A_i will give a minimum of errors. This method can be used with a description of objects and any volume of experimental data. It is based on minimal a priori assumptions and is easily realized with an electronic computer. Orig. art. has: 3 formulas.

TITLE: Electron Microscopic Study of the Morphological Changes in STI Anthrax Vaccine Spores Under the Influence of Certain Disinfectants

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, Nr 6, pp 74-78 (USSR)

ABSTRACT: Using a Soviet EM-3, 1949 model, electron microscope with a magnification factor of 5,000 X and an accelerating voltage of 40 kv, the authors studied the morphological changes which occur in the spores of live STI anthrax vaccine under the action of aqueous solutions of formaldehyde, monochloramine, diocide and a mixture of 17% formaldehyde in water and 10% monochloramine (Disinfectant mixture Nr 2). Formaldehyde was found to produce no visible changes in the spores. The chlorous preparations, however, caused swelling and a decrease in the electron-optical density of the spore membranes. This, according to A.Ye. Kriss and V.I. Biryuzova, is evidence of a profound biochemical reconstruction in the spores connected with disintegration of the high-molecular compounds and their transformation into low-molecular ones. D.V. Nayzi and V.I. Vashkov have pointed out that the greater resistance of spores, compared to the

Card 1/2

SOV/16-59-6-15/46

Electron Microscopic Study of the Morphological Changes in STI Anthrax Vaccine Spores
Under the Influence of Certain Disinfectants

vegetative forms of microbes, is due to their possessing a strong impermeable membrane. The strong sporicidal action of disinfectant mixture Nr 2, then, may be due to rapid penetration of the formaldehyde into the spores due to rarefaction and increased permeability of their membranes because of the action of the monochloramine.

TITLE: Further experimental studies of the efficacy of chemical
anthrax vaccine

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii,
no. 8, 1964, 45-50

TOPIC TAGS: vaccine, antigen, anthrax

ABSTRACT: Rabbits were vaccinated with unsterilized anthrax antigen,
formalin-sterilized anthrax antigen, and live CTH vaccine, then
infected with a virulent strain of B. anthracis. Comparison of
results for the three groups showed no difference in efficacy between
the unsterilized antigens containing viable CTH cells and the formalin-
sterilized antigen. The survival rate was 11 out of 12 rabbits in the
first group, 9 out of 11 in the second group, and 11 out of 11 in the
third. All the controls died. The immunogenic effect of the antigen

Card 1/4

ACCESSION NR: AP4043756

thus neither depends on nor is enhanced by the presence of viable cells in the vaccine. Formalin-sterilized antigen was used in the remainder of the experiments. The dependence of the degree of immunity induced on the size of the vaccination dose was also investigated in rabbits. The level of immunity was directly dependent on dose size: less than half (5 out of 12) of the rabbits vaccinated with 50 mg of antigen survived infection with 100 Dlm of virulent B. anthracis. Larger doses (100 mg and 300 mg) were about equally efficacious (survival of 6 out of 9 and 7 out of 9 rabbits). All the controls died. The dependence of immunogenic effect on the number of injections into which the vaccination dose is split and on the time interval between them was studied next. A total vaccination dose of 100 mg was administered in one, two, and three injections. Up to 20 days following completion of vaccination, the number of injections made no real difference in immunogenic effect. Mortality increased sharply when immunity was tested 40 days after completion of the vaccination series, however. The immunity produced by live CTH vaccine was longer lasting, and did not fall off sharply until 80 days after vaccination. It should be noted that the CTH dosage

Card 2/4

ACCESSION NR: AP4043756

used (250×10^6 spores) was five times the dose recommended for humans. The efficacy of anthrax antigen was also studied in rhesus monkeys, in which 300 mg of antigen administered in either two or three injections produced a somewhat stronger immunity than did the live CTH vaccine in human-size doses. A final experiment was conducted to determine the efficacy of "native-sorbed" antigen concentrate (obtained by $Al(OH)_3$ precipitation of the culture filtrate without first treating the latter with acid or alcohol). This process not only yields an antigen which is more effective than that obtained by alcohol sorption, but produces it in quantities 15 times greater than the yields attainable by the alcohol process. The results of the experiment showed the immunogenic activity of "native-sorbed" antigen to be about the same as that of acid-sorbed antigen. In view of the much higher yield of the native-sorbed antigen concentrate, its use would seem to be preferable to that of the others. These concentrates produced practically no local reaction, unlike the formalin-sterilized antigen used in the earlier experiments. Orig. art. has: 3 tables.

TITLE: Molybdenum molds for pressure die casting of steel A

SOURCE: Liteynoye proizvodstvo, no. 3, 1966, 37-38

TOPIC TAGS: molybdenum, pressure casting, metal casting, hot die forging/3Kh2V8 steel, TsSDM molybdenum

ABSTRACT: 3Kh2V8 steel as well as copper alloys, which are currently used as the materials of molds for pressure die casting of steel, are of insufficient strength, and this hampers the widespread introduction of pressure die casting. In this connection, the authors experimented with the use of TsSDM molybdenum, obtained by powder-metallurgical methods. Sintered blanks weighing up to 16 kg, measuring 90 mm in diameter and 180 in height, were drop-forged into 40x15x160 mm sheet bars (at temperatures beginning with 1600-1650°C and ending with 1100-1200°C). Molds made of sintered and deformed Mo were heated at various temperatures,

Card 1/2 UDC: 621.744.3.004.6:621.74.043.2:669.14

ACC NR: AP6021265

thus establishing that the danger of the breakage or hot cracking of the molds can be eliminated if they are heated to 300°C when used in the pressure die casting of 20 and 1Kh18N9T steels. Their service life is longer than that of 3Kh2V8 steel: they retain a satisfactory shape after being re-used 540 times, whereas molds made of 3Kh2V8 steel can be satisfactorily re-used only 240 times. Thus, the use of molybdenum molds may markedly reduce casting cost. Orig. art. has: 3 figures and 3 tables.

PERIODICAL: Geodeziya i kartografiya, 1958, Nr 12, pp 53-56 (USSR)

ABSTRACT: The Prikaspiyskaya ekspeditsiya geograficheskogo fakul'teta MGU
(Expedition to the Regions of the Caspian Sea of the
Geographical Dept. of Moscow State University) examined in
1948-55 wide areas of Sarpinskaya lowland, the Chernyye zemli,
the Nogayskaya steppe, the Volga-Akhtuba flood land
and the Volga delta with a total surface of
100,000 km² that should be partially irrigated and economically
opened up. In 1948-50, geographical examinations were made for
the first stage of the scheme (general schedules were set up).
Then, physical-geographical and economic-geographical special
maps at small and medium scales were made up. In subsequent
years, the most typical sections were examined in detail.
On account of this work, large-scale maps were produced.

Card 1/2

, Cartographical Work in the Complex Study of
Half-Desert Regions

SOY/6-58-12-10/14

The work of the first stage was carried out by special sections (geomorphological, soil-geobotanical and economic-geographical sections). Cartographers took part in the office and field work. The work in the two stages is here pointed out in short. The work carried out here showed that in extensive geographical expeditions the presence of cartographers in all stages of work is indispensable for the making of special maps with universal characteristics of the region.

Condensation of *o*-aminothiophenol with heterocyclic carbonyl compounds. I. Pyridine derivatives. V. H. Zubrovskii and A. I. Kuznetsov, *Zh. Obshch. Khim.*, 2, 140-1 (1953). Heating 3.7 g. nicotinic acid with 3.8 g. $\text{C}_6\text{H}_5\text{NC}_2\text{H}_4\text{SH(II)}$ in sealed tube 6 hrs. to 140-150° (15° rise per hr.) gave 31% 2-(2-pyridyl)benzothiazole(II), m. 135° (from EtOH). A 100% yield is obtained from C_6H_5 soln. of I and picolinyl chloride. The product is sol. in hot dil. HCl or cold concn. HCl; *picrate*, m. 140-1° (from EtOH). II heated with MeI 1 hr. at 100° failed to react; EtI gave the same result. Mixing C_6H_5 solns. of 4.17 g. *o*-methylaminothiophenol with 4.33 g. picolinyl chloride and boiling 20 min. and treatment of the product with aq. KI gave 4.6 g. 3-methyl-2-(2-pyridyl)benzothiazolium iodide, m. 180-2° (decomn., from EtOH). This heated with MeI in sealed tube to 100° failed to react. Heating the above iodide to unstated temp. gave MeI and II. Heating 10 g. nicotinic acid with 10 g. II 6 hrs. at 130-5° gave 34% 2-(2-pyridyl)benzothiazole, m. 128-9° (from EtOH); a 57% yield results from using nicotinoyl chloride and I in C_6H_5 ; *picrate*, m. 194-5° (from Me₂CO); *HCl salt*, m. 215° (from EtOH). Heated with MeI to 100° 1 hr. it gave the *methiodide*, m. 231-2° (from EtOH); *sulfide*, m. 223-4° (from EtOH). Nicotinoyl chloride and *N*-methyl-*o*-aminothiophenol treated as above described gave 3-methyl-2-(2-pyridyl)benzothiazolium iodide, yellow, m. 186-8° (from H₂O), which heated to 203-25° isomerizes to the *methiodide*, m. 232° identical with the one described above. Equimolar mixt. of isonicotinic acid and I heated 4 hrs. at 210-40° gave 65% 2-(4-pyridyl)benzothiazole, m. 131° (from pair. ether); *picrate*, m. 237°. Heating the base with MeI 0.5 hr. at 100° gave the *methiodide* (III), m. 256°, orange; *ethiodide*, m. 219-20°. Reaction of isonicotinoyl chloride with *o*-methylaminothiophenol, as above, gave 3-methyl-2-(4-pyridyl)benzothiazolium iodide, dark red; at 185°, m. 107° to dark liquid which changes to crystals, m. 253°; heating to 185-120° gives III, m. 256°. Thus the *methiodides* whose Me group is on benzothiazole N are similar to those with Me on the pyridine N.

TITLE:

Representation of Basic Elements of Content on School Wall Maps
(Izobrazheniye osnovnykh elementov ~~sozhdaniya~~ na stennykh ucheb-
nykh kartakh)

PERIODICAL:

Geodeziya i kartografiya, 1959, Nr 7, pp 44 - 51 (USSR)

ABSTRACT:

In editing and compiling school maps, the choice of details in drawing the individual elements is the most complicated part of work. Most errors on school maps originate because of an incorrect understanding of the degree and possibility of generalization on topographic maps of this kind. The directions issued in 1950 for the compilation of school maps do not clarify this problem, and do not deal correctly with the whole problem. They mechanically put the same requirements as to generalization to school maps as to reference or topographic maps on a large scale. The degree of generalization, and the size of the signs on a map, are determined by its scale and destination. The degree of generalization applicable to most hand maps is absolutely unacceptable for school maps on the same scale. In school maps, the main characteristics of an area must be clearly expressed.

Card 1/2

Representation of Basic Elements of Content on School
Wall Maps

S07/6-59-7-15/25

Details make the school map less distinct. Starting from this point of view, some recommendations are given here with concrete examples of coast and shore lines, hydrographic representations, places and traffic routes, frontiers and relief. For the representation of places, the paper by T. M. Lapshina, S. N. Soldatov and M. B. Sukhodrev in *Geodeziya i kartografiya*, 1956, Nr 7, is referred to, and for the relief representation on school maps, the paper by T. N. Gunbina and A. N. Spiridonova in the *Trudy TsNIIGAIK*, 1938, Nr 21. There are 6 figures and 2 Soviet references.
