TITLE: Explosive Forming

PERIODICAL: Technické noviny, No. 15, April 12, 1961, p.3

TEXT: Závod na výrobu vzduchotechnických zařízení (Pneumatic Equipment Manufacturing Plant), Milevsko are introducing explosive forming for the manufacture of pressure vessels (central cylindrical section for mounting on) railway wagons. Explosive forming proved successful particularly in forming cylindrical shapes into aerodynamic ones and for very high accuracy forming. Experiments were carried out on models one-third of the natural size. Analysis of this method and of test results has shown that explosive forming has to be judged from a number of points of view. The choice of the explosive depends on the transfer medium, the shape of the die and its dimensions, the material to be formed and the technological facilities available. A cylindrical sheet ring is placed in the die and tightened thoroughly with rubber or other packing material. The space inside the ring is filled with water into which a suitably

Explosive Forming

arranged charge is placed which is then ignited by an electric spark. The explosive is transformed into gases of high temperature and pressure which produce a shock-wave in the surrounding medium, the front of which propagates at high speed and pushes ahead of it the medium which originally surrounded the charge. In the given case this medium was water, which is an ideal medium for transmitting high pressures. Explosive forming is economical for very large components and components of difficult shape. In the case of very tough materials, the quality of forming is determined by the explosive. The shape of the explosive determines the characteristic of the process of propagation of the energy and the pressure as a function of time. Introduction of explosive forming was proposed by the Assistant Technical Director Josef Poláček; the chief technologist, Jiří Lauterbach and technologists Robert Vošahlik and Bohumil Kulíšek participated in the work. There is 1 figure. X

Title : On the Molecular Extinction Coefficient of Dithizone and of Lead Dithizonate in CCl_4 .

Orig Pub: Bull Scient Conseil Acad RPFY, 3, No 2, 52 (1956) (in German).

Abstract: The extinction coefficients of solutions of dithazone (I) and of lead dithizonate (II) in CCl_4 have been measured. The measurements were made at λ (max) 620 and 520m μ . Values of ϵ I = $3.64 \cdot 10^4$ and ϵ II = $7.29 \cdot 10^4$ were obtained.

For the measuring of extinction the photometer is provided with a slit which makes it possible to take readings on a uniformly graduated scale fitted with a vernier. The apparatus is provided with up-to-date, narrow interference light filters which in addition have a high degree of light transmittance. The intensity of the current feeding the bulb must be kept at a constant value by means of an ammeter and a series resistance. The photometer is suitable for determining extinction values ranging from 0 to 1. It attains a measuring accuracy of 0.01.

TITLE: A hydraulic press with weight distribution on the base components. Class 58, No. 186283 [announced by the Kolomna Heavy Machine Tool Building Plant (Kolomenskiy zavod tyazhelogo stankostroyeniya)]

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 154-155

TOPIC TAGS: hydraulic equipment, metal forming press

ABSTRACT: This Author's Certificate introduces a hydraulic press with weight distribution for the base components. The installation contains a stand in the form of columns connected by crossbeams, a movable frame of similar construction located inside the stand, a lower working cylinder mounted in the lower crossbeam of the movable frame, and an upper working cylinder. Misalignment of the press under the effect of eccentric loads is prevented by mounting the upper working cylinder in the upper crossbeam of the stand with rigid connection of the plunger for this cylinder to the upper crossbeam of the movable frame.

AUTHOR: Votyakov, L.D.

TITLE: On the Problem of Determining the Cutting Properties of Tools and
the Machinability of Metals by Cutting 14

PERIODICAL: Tr. Ural'skogo politekhn. in-ta, 1959, Vol. 80, pp. 28-32 ✓

TEXT: The author cites the definition which is given by OCT (OOST) on the machinability of metals by cutting and on the cutting properties of tools. The author is of the opinion that the established criteria of machinability, based on the magnitude of cutting speed at a given durability of the tool, is not sufficiently complete, while a determination of the cutting properties of the tools by the coefficient does not disclose the physical conception of the investigated phenomenon. It is suggested, based on the interrelation between cutting speed and tool wear, to consider the machinability as the ability of the metal to wear out the tool under the given particular conditions, while the cutting properties of the tool is its ability to resist wear. It is pointed out

Card 1/2

S/123/60/000/009/009/017
A004/A001

On the Problem of Determining the Cutting Properties of Tools and the Machinability of Metals by Cutting

that the most objective criterion of cutting properties of the tool is its resistance to wear or the ratio of tool wear to volumetric unit of removed metal or (for finishing machining) the ratio of tool wear to unit of area of machined surface. The author presents a formula for the determination of volume of worn away tool material in mm^3 per volume unit of removed metal in cm^3 per 1,000 m of tool travel. Citing examples it is shown that the suggested criteria are convenient for the determination of the cutting properties of the tool depending on the cutting conditions for the comparison of the machinability of different metals, and for the comparison of the cutting properties of tools made of the same material. It is pointed out that the data on the specific wear may be converted into the cutting speed magnitude at a given durability and could be made use of as correction factors for the determination of cutting conditions. ✓

TITLE: The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion of the 40th Anniversary of the Belorussian SSR

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, Nr 6, pp 112-117 (USSR)

ABSTRACT: This is a history of the Belorusskiy institut epidemiologii, mikro-biologii i gigiyeny (Belorussian Institute of Epidemiology, Microbiology and Hygiene), its activities and some of its scientific associates. Among the well-known scientists who received their training at the Institute are: Honored Scientist, Doctor of Medical Sciences, Professor B.Ya. El'bert, Corresponding Member of the AMN, USSR, Doctor of Medical Sciences, Professor E.K. Mogilevchik, Doctor of Medical Sciences, Professor I.A. Sutin, Doctor of Medical Sciences S.I. Gel'berg, Docents and Senior Scientific Associates I.S. Rubinshteyn, V.I. Votyakov, A.O. Sakovich, D.Ye. Zibitsker, Ye.Ye. Sokgobenzon, B.B. Rubinshteyn, G.I. Rakhmanchik, Candidates of Medical Sciences M.Sh. Levin, R.I. Levina, A.V. Gritskevich, Ts.A. Perlis, L.I. Nikonovich, etc. The Institute produces one of the best tuberculosis vaccines in the USSR. It has conducted a number of investigations (Brandin,

Card 1/5

SOV/16-59-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion of the 40th Anniversary of the Belorussian SSR

Frid, etc.) to improve the microbiological methods of diagnosing tuberculosis. The Institute has studied the importance of the neuroreceptor areas in rabies infection in animals and in immunization with rabies antivaccine. Zibitsker and Korotkevich have developed a method of determining the immunogenic properties of rabies vaccines by infecting immunized mice with fixed rabies virus. Attempts are being made to prepare a dry rabies vaccine. The Institute has devised experimental techniques for estimating the virulency of small-pox vaccine in guinea pigs, has carried out clinical investigations on immunized children and studied means of preserving the heat-resistance and immunogenic properties of small-pox vaccine. Studying the mechanism of paratyphoid B fever and immunity, Rabinovich showed the importance of the barrier function of the Mechnikov macrophage system and the other elements of the reticulo-endothelial system. Attempts to improve dysentery bacteriophage were made by using the technique of guided variation of *Shigella shigae* and *Escherichia coli*. Manolov, Rakhmanchik, Kruglik, Kulikova and Timofeyeva in 1955 tried to rationalize the different methods of dysentery diagnosis. Studies of nidi of infections caused by pathogenic *Escherichia coli* have also been performed. In its work on diphtheria the Institute has done

Card 2/5

SOV/16-9-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion of the 40th Anniversary of the Belorussian SSR

research in: the selection of horses for diphtherial hyperimmunization, preserving immune sera with chinosol, the titration of immune sera and the reactive properties of crude, heated and refined sera, the removal of ballast proteins from sera (Levin and Sosina). A number of bacteriological and experimental investigations have established the desensitizing action of novocaine and the magnesian drugs, also the desensitizing and antibiotic properties of citral. Livshits, Agronovich, Bukobytsova, etc. have demonstrated that citral has good therapeutic effects on furunculosis, postnatal infections, stubborn forms of rheumatic polyarthrititis and shin ulcers. Votyakov and Nikonovich have demonstrated the importance of functional changes in the central nervous system in the pathogenesis of gas gangrene. The Institute has developed a method for the differential diagnosis of the scleroma bacillus from the other microbes in the capsule group, using agar-microscopy, and has described new varieties of bacilli in this group. It constantly organizes expeditions to study the epidemiology of scleroma in Belorussia and has also taken an active part in the anti-malaria campaign. Studies have been made of the natural foci of tularemia in Belorussia and the Institute has demonstrated the effectiveness of vaccination against this disease. The Institute's workers have

Card 3/5

SOV/16-59-6-23/46

The Belorussian Institute of Epidemiology, Microbiology and Hygiene on the Occasion of the 40th Anniversary of the Belorussian SSR

traced the source of brucellosis to cattle and attribute the spread of leptospiroses to field and domestic rodents. Protas, Savitskiy, etc. have put forward the hypothesis that the seasonal outbreaks of encephalitis in Belorussia are caused by infected goat's milk. Selivanov, Zibitsker and Votyakov have studied the etiology and epidemiology of influenza and the efficacy of influenza vaccination. Studies have also been made on: the epidemiology and early diagnosis of epidemic hepatitis, aldolase activity as an index to the diagnosis of Botkin's disease, the efficacy of intradermal immunization with the Salk vaccine. The Institute is investigating the sporadic outbreaks of typhus and is working on a method for preparing a rickettsiosis antigen from lice adapted to rabbits (Kosobutskiy). Indications have been received that trichinosis is widespread among wild animals in Belorussia. Trichinella antigens have been prepared and immunological methods of diagnosing this disease worked out. Similar work has been performed on diseases caused by tapeworms, enteritic protozoa and Toxoplasma. New laboratories have been set up to produce

of the 40th Anniversary of the Belorussian SSR

gamma-globulin, diagnostic preparations, including dysentery, typhoid, scleroma, dry complement and hemolytic sera. The Institute has mastered the production of antirabies vaccine from sheep's brains. The Institute works in close cooperation with the Belorussian public health service and also does much to improve the scientific qualifications of its associates.

Immunological and Epidemiological Effectiveness of Live Poliomyelitis Vaccine in the USSR

A. A. SAKHOBENTEV, A. I. DROBYZHEVSKAYA, N. P. BILYCHENY
G. M. CHALIKINA, G. M. GORISMAN, V. I. RYBKOVA, E. A. KANTONOVICH
L. M. KORNOSOVA, E. G. VASILEVA, V. I. VOTYAKOV, A. G. P. ZHILOVA

In 1959 a total of 750,000 children up to 14.14 years old in the Latvian, Lithuanian, Moldavian, and Estonian Republics of the USSR were given live poliomyelitis vaccine prepared from Swedish Polio virus. 94 percent show the vaccine as highly effective and quite innocuous.

The same conclusion is substantiated by the different epidemiological data which indicate that among very young children the age group of parents had up to age 15-16. It appears that the vaccine was administered to the children of the parents who were themselves vaccinated in their childhood. The number of cases of paralytic poliomyelitis was also reduced in the unvaccinated control regions. The number of cases of paralytic poliomyelitis was especially among unvaccinated children but relatively high among children in parental or grandparental care. The authors also found immunization of parents in the family of the child and immunization of the child in the family of the grandparent. The authors also note the importance of the immunization of parents and grandmothers in order to reduce the incidence of paralytic wild virus of poliomyelitis.

The epidemiological situation appears to be a form characteristic with Type 2 and 3 poliovirus. The authors also note the importance of the immunization of parents and grandmothers in order to reduce the incidence of paralytic wild virus of poliomyelitis.
