TITLE: A method for bending sectional profiles from sheet stock. Class 7, No. 185827

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 21

TOPIC TAGS: sheet metal, metal bending, bending machine

ABSTRACT: This Author's Certificate introduces a method for bending sectional profiles from sheet stock. Cross sections with internal bending radii close to zero are produced from material with low ductility by additional bending with the application of compressive force to shelves on the prebent profile along lines which are normal and tangent to the central axis of the cross section.

TITLE: Some problems of the electronics of alloyed transistors

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
no. 5, 1961, 55 - 64

TEXT: The article is an account of the quantitative comparison of alloyed-transistor theory with the experimental results. It is shown that the condition of charge neutrality in the base holds in real transistors and that, in contrast to earlier theories, the influence of the longitudinal electric field is negligible at all injection levels. Furthermore, the empirical dependence of the effective lifetime on the injection level is found. A short review of the literature on transistor theory is given. In approximations made in earlier small-signal theories, it is assumed that the concentration of injected carriers in the base is small compared with the majority of carriers; this assumption is rarely justified in actual devices. Experimental work has been reported showing

Card 1/5

30470

S/139/61/000/005/006/014
E036/E335

Some problems of

qualitative agreement with the earlier theories, any discrepancies being attributed to differences between the actual transistor and the ideal device. The present work, however, shows that there are definite contradictions between these theoretical results and experiments at large injection levels for several types of transistor. The input resistances in common-base and common-emitter connections as a function of current were measured to study the boundary conditions at the emitter-base junction. Using the measured low-frequency value of r_b' , good agreement between theory and experiment was found for input resistance as a function of injection level (z). To study the influence of the longitudinal field the cut-off frequency (ω_a) and effective diffusion constant were measured as a function of the collector current by several methods. A definition of ω_a is used which allows for the higher injection levels exhibited at even relatively low collector currents. This ω_a must then be related to the cut-off frequency (ω_a') of an actual transistor

Card 2/5

30470

S/139/61/000/005/006/014
E036/E335

Some problems of

by allowing for junction capacitances and base-resistance, etc. For $z \ll 1$ the change of ω_a is due to the emitter-junction barrier capacitance and the variation for $z \gg 1$ is related to the base-resistance in the collector circuit r_b'' and to the diffusion and barrier capacitance of the collector junction. The apparent reduction of ω_a at small injection levels can be explained by errors in determining the emitter junction barrier capacitance. The reduction at high injection levels is due to a transverse field arising from the base current and to curvature of the emitter surface, etc. The apparent increase of ω_a with injection level reported by other workers is due to insufficiently complete account being taken of the differences between the actual transistor and the theoretical model. Also, the reduction of the input diffusion capacitance at high injection levels is due, not to the longitudinal field, but to a change in the emitter boundary conditions. To clarify the effect of junction curvature and radial potential drops, the effective base width and diffusion constant (D^*) were measured

Card 3/5

Some problems of

30470
S/139/61/000/005/006/014
E036/E335

as a function of current. The calculated value of D^* was constant ($40.5 - 45 \text{ cm}^2/\text{sec}$) for injection levels of 0 to 5-7. It was found that the current gain α_{cb} as a function of current can be described by the equation:

$$\alpha_{cb} = \alpha_{cb}(z=1) [1 + \sigma \lg z] \quad (16)$$

4

for $0 < z < 1$, where σ is constant for a given transistor. This increase of α_{cb} is supposed to be due to an increase of the effective lifetime τ . Good agreement is found between the plot of α_{cb} and of τ against current, τ being measured on the device. As the current is further increased, quantitative agreement with theory is possible, the fall in α_{cb} being due to reduced emitter efficiency. S. Ryabinkin is mentioned in the article for his contributions in this field.

AUTHOR: Vozhenin, I.N.

TITLE: Calculation of the output current of fused semiconductor triodes for arbitrary signals across the junction

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika, no.6, 1961, 14-21

TEXT: In a previous paper the author and G. A. Blinov (Ref.1: Izv.vuzov, Fizika, No.5, 55, 1961) reported experimental studies of semiconductor triodes. It is concluded from that work that for an arbitrary injection level the dependence of the collector current on the voltage drop across the junctions can be established by solving the equation

$$\frac{dp}{dt} = - \frac{p - p_0}{\tau_p^x} + D_p \frac{\partial^2 p}{\partial x^2} \quad (1)$$

subject to the boundary conditions

$$p_2 = p_0 \exp(\mu V_k) \quad (\text{collector contact}) \quad (4)$$

Card 1/4

Calculation of the output current ... S/139/61/000/006/001/023
EO32/E514

and $n_1 p_1 = (N_d + p_1) p_1 = n_i^2 \exp(\mu V_s)$ (5)

In the above expressions D_p is the hole diffusion coefficient, τ_p^x is the lifetime of holes in the base, including surface recombination effects, p_6 is the concentration of holes in the base, $\mu = q/kT$, q is the electronic charge, x is the coordinate measured from the emitter to the collector, N_d is the concentration of donor atoms, the subscript 3 refers to the emitter and p_1 is given by

$$p_1 = p_6 \exp(\mu V_s) \text{ (emitter contact)} \quad (3)$$

Eq.(1), which gives the behaviour of the minority carriers in the base, is solved on the linear approximation subject to the non-linear boundary conditions given by Eqs.(4) and (5). This will hold for small injection levels when the base of the triode can be divided into an electrically neutral layer, and emitter and collector space-charge regions. The effect of the field on the behaviour of the minority carriers is then small compared with the

Card 2/4

34183

Calculation of the output current ... S/139/61/000/006/001/053

effect of diffusion and recombination. It is shown that if the triode input current is given by

$$I_{bx} = \frac{J_{bx0}}{2} + \sum_{n=1}^{\infty} J_{bxn} \sin(n\omega t - \varphi_n),$$

then the solution of the above equations leads to the following expression for the output current

$$\begin{aligned} I_o(t) = & \frac{\alpha_0 J_{bx0}}{2} + \sum J_{bxn} \alpha_n \sin(n\omega t - \varphi_n - \eta_n) - \\ & - I_{ko} e^{-\mu E_{ko}} \sum_{n=0}^{\infty} J_n(\mu a) \left[\operatorname{Re} \frac{W_2 s_n}{\operatorname{th} W_2 s_n} \cos n\omega t + \operatorname{Im} \frac{W_2 s_n}{\operatorname{th} W_2 s_n} \sin n\omega t \right] - \quad (40) \\ & - \frac{v_1 d_n \alpha_0 J_{bx0}}{2 W_0} \left[\operatorname{Res}_1 W_0 \operatorname{th} s_1 W_0 \cos \omega t + \operatorname{Im} s_1 W_0 \operatorname{th} s_1 W_0 \sin \omega t \right]; \end{aligned}$$

Card 3/4

Calculation of the output current ... S/139/61/000/006/001/023
E032/E51⁴

where $\frac{d_o \alpha_o J_{BXO}}{2E_{OK} W_0}$ Re $s_1 W_0$ with $s_1 W_0 = g_{kk}$ is the active admittance
of the collector junction and $\frac{d_o \alpha_o J_{BXO}}{2\omega E_{OK} W_0}$ Im $s_1 W_0$ with $s_1 W_0 = C_{dk}$ is

the diffusion capacitance of the collector junction (both with open-circuited input). Analysis of Eq.(40) shows that the collector current consists of the emitter current, whose harmonics are attenuated by a factor of α_n and shifted by an angle η_n (first sum), the collector diode current due to positive collector-base voltage pulses (second sum), and a collector-junction conduction current due to the change in the thickness of the junction. In the derivation of Eq.(40) the distributed base resistance was neglected. There are 1 figure and 1 Soviet-bloc reference.

TITLE: Double decomposition of alkyl(aryl)trisodium oxysilanes and methylphenyl dichlorosilane

SOURCE: AN SSSR, Izvestiya. Seriya khimicheskaya, no. 4, 1965, 660-665

TOPIC TAGS: silane, IR absorption spectrum, polymerization, polycondensation, sodium compound

ABSTRACT: The double decomposition of trisodium salts of alkyl(aryl) silanetriols and methylphenyl dichlorosilane was studied. In order to use the reaction for obtaining trifunctional splitting of oligomers with functional groups at the ends of the branches, the synthesis was carried out with 1 mole of alkyl(aryl) trisodium oxysilane for 3 moles of methylphenyl dichlorosilane. Sodium naphthalene obtained by treating alkyl(aryl)polystioxane with an alcohol solution of sodium were used. The double decomposition reaction was carried out below 10° with gradual introduction into a solution of methylphenyl dichlorosilane of a suspension of the trisodium salt in toluene. Analysis of the resulting products

Card 1/3

L 5445-65

ACCESSION NR: AP5012450

shows them to contain but an insignificant amount of functional groups. The chlorine content was but 0.1% as against an expected 17.17%, on the assumption of course the reaction would follow. Only traces of the hydroxyl group were detected after treatment with water. These data indicate that the double decomposition does not follow the expected pattern, but that it is apparently accompanied by hydrolytic processes that limit the formation of cyclic compounds of complex structure. This view is supported by the presence of crystallization water in alkyl(aryl) silanetriols. For the double decomposition reactions, sodium salts of methyl, ethyl, and phenyl silanetriols were used. These yielded 1,7-dimethyl-3,5,9,11,14,16-hexamethylhexaphenyl bicyclo (5,5,5) octasiloxane; 1,7-diethyl-3,5,7,11,14,16-hexamethylhexaphenyl bicyclo (5,5,5) octasiloxane; 1,7-diphenyl-3,5,9,11,16-hexamethylhexaphenyl bicyclo (5,5,5) octasiloxane. The physical properties, infrared spectra, structure, and properties of the compounds are tabulated. Infrared spectra of all compounds exhibit an absorption band in the 1020-1090 cm^{-1} region, corresponding to vibration of the Si-O bond in eight-member rings. No characteristic band for Si=CH was detected. Supplementary experiments on catalytic polymerization and thermal polycondensation demonstrated that the compounds are polymerizable by means of 1% NaOH at 80°C and that thermal polycondensation, which was

TITLE: Distribution of effective velocities in the West Turkmenian Depression

PERIODICAL: Akademiya nauk Turkmeneskoy SSR. Izvestiya. Seriya fizika-tehnicheskikh, khimicheskikh i geologicheskikh nauk, no. 4, 1960, 40-45

TEXT: The results of seismic prospecting carried out by the method of reflected waves in respect of the distribution of effective velocities in the West Turkmenian Depression are discussed. The analysis of experimental data revealed a monotonous increase of effective velocities at greater depths, which is probably due to the gravitational consolidation of the strong Kainozoic stratum. The regional plan shows an increase in effective velocities from west to east and from south to north, corresponding to the weakening of Kainozoic and the increase in more compact Mesozoic formations. At the same time there is an apparent linear dependence between effective velocities and the density of strata, i.e., higher effective velocities generally correspond to more compact strata. Finally, the presence of gas and/or oil deposits in multi-stage strata may result ✓

Card 1/3

Distribution of effective velocities ...

8/165/60/000/004/005/012
A104/A129

in considerable absorption of the elastic pulse and consequently in marked decrease of effective velocities. Effective velocities were determined either by the selective method or on the basis of theoretical hodographs compiled by Yu.V. Riznichenko. Graphs were compared in accordance with the tectonic division established by Yu.N. Godin and the tectonic structure plan of Neogenic deposits. Effective velocity charts were compiled according to dependences of $V_{eff} = f(t)$ and $V_{eff} = f(H)$ at values of $t = 1.0, 1.5, 2.0, 2.5$ sec and $H = 1,000, 2,000$ and 3,000 m. The effective velocity charts confirm the information of structure charts, i.e., maximum velocities recorded in the anticline of the fold, minimum in syncline depressions. Highest velocities were recorded at the foothills of Kuba-Dag, Bol'shoy and Maly Balkhan and in parts of the Western Kopet-Dag. Lowest velocities were established in the lowest central region of the Transcaspian Depression. There is as yet no explanation for the anomaly of the V_{eff} observed in the Aladagskaya Fold. The analysis of listed data indicates a direct connection between values V_{eff} and the geological formation of the investigated area. In these particular cases, values V_{eff} were influenced by: tectonic formation, condition and geotectonic development of stages, lithological composition of strata, consolidation and the stratigraphic age. Frequently V_{eff}

ORG: Institute of Metal Physics, AN UkrSSR (Institut fiziki metallov AN UkrSSR) 38

TITLE: The relationship between the characteristics of superconductivity and
structure of zirconium-4% niobium alloy 21 13

SOURCE: Fizika metallov i metallovedeniye, v. 21, no. 3, 1966, 388-395

TOPIC TAGS: zirconium alloy, niobium containing alloy, alloy structure, alloy
superconductivity 21

ABSTRACT: Zirconium-base alloy containing 4% niobium melted from 99.8%-pure zirconium and 99.4%-pure niobium, rolled at 600-700°C into bars, homogenized at 1280°C for 50 hr, annealed at 1200°C and water quenched, aged at 550°C for up to 1000 min, and rolled at 550°C with a reduction of 93% was tested for the effect of structure on the characteristics of superconductivity. It was found that alloy annealed at 1200°C is not superconductive at 4.2K. Aging of annealed alloy at 550°C for 15 min brings about a precipitation of the finely dispersed β -phase and the alloy becomes superconductive with a critical current density of 5000 amp/cm². The β -phase particles precipitate mainly at the boundaries of the martensitic needles and form a system of superconductive fibers in the nonsuperconductive matrix. Such a structure appears to have a favorable effect on the magnitude of the critical current density. Prolonged aging of annealed alloy has no additional effect on the critical current. Card 1/2 UDC: 537.312.62:548.4

L 20642-66

ACC NR: AP6010405

density. Alloy which, after annealing, was rolled at 550°C also became superconductive after aging at 550°C for 3 hr, but its critical current density was found to be 50,000 amp/cm² (one order higher than that of alloy aged without rolling). The structure of alloy in this condition is distinguished by a network of dislocations decorated by rather large (50–100 Å) particles of δ-phase and forming a system of superconducting fibers. Such a structure appears to be a specific feature of all niobium-zirconium alloys with high values of critical current density. Orig. art. has: 4 figures. [DV]

TITLE: The use of the portable DP-2 apparatus for mass oxygen inhalation

SOURCE: Voyenno-meditsinskiy zhurnal, no. 12, 1966, 74-75

TOPIC TAGS: biologic metabolism, hyperoxia, clinical medicine, ~~oxygen equipment~~, ~~oxygen equipment~~, OXYGEN CONSUMPTION, MEDICAL EQUIPMENT

ABSTRACT: The portable DP-2 apparatus has been suggested for mass oxygen inhalation. The equipment is built with one-cm rubber tubes, three-inch plastic tubes, oxygen funnel inhalers, and polyvinyl chloride or transparent oilskin sacks. The design of the system is shown in Fig. 1.

Card 1/3

UDC: 615.473:615.777.4

ACC NRAP7003295

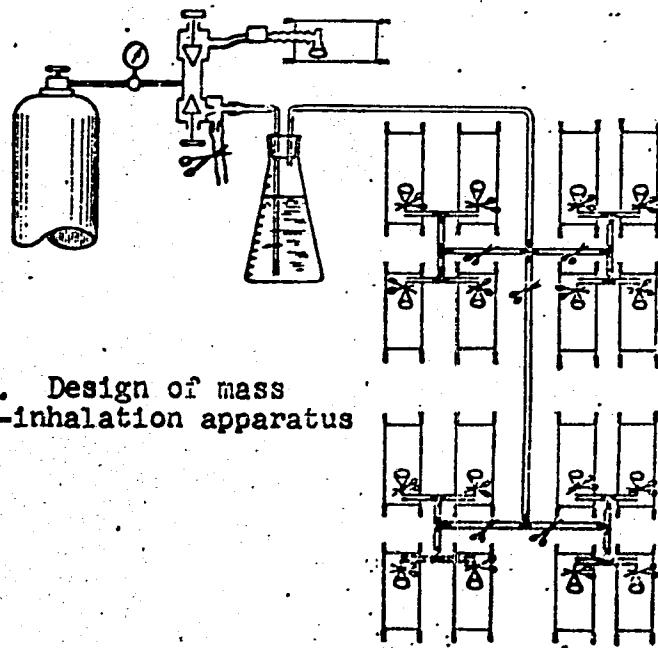

Fig. 1. Design of mass oxygen-inhalation apparatus

Card 2/3

ACC NR: AP7003295

The volume of oxygen conveyed per min relative to the number of inhalers can be calculated according to the formula $\frac{V}{t} = \frac{V_{O_2}}{t_{O_2}}$ to be:
2 inhalers \rightarrow 4 l; 4 inhalers \rightarrow 8 l; 6 inhalers \rightarrow 12 l; 8 inhalers \rightarrow 16 l; 10 inhalers \rightarrow 20 l; 12 inhalers \rightarrow 24 l; 14 inhalers \rightarrow 28 l; 16 inhalers \rightarrow 32 l. Pure oxygen is fed into the system through a rubber tube attached to the nozzle of the injector; at the same time a short rubber tube on the filtering nozzle of the apparatus is cut off by a clamp. To create an oxygen-air mixture, the intake nozzle of the aspirator is kept open so that atmospheric air is drawn in. Oxygen content varies from 35--60% depending on the intake rate. The valve is gaged for intake of the oxygen mixture by a similar method. The amount of oxygen or oxygen-air mixture necessary is calculated relative to the number of inhalers. An advantage of the system is that it may be used on the battlefield when there are insufficient standard oxygen inhalation stations. It is also recommended for hospitals for educational and practical purposes.

TITLE: On the Problem of the Application of the Calculation Formula
to the Production of Buffer Solutions (K voprosu o primenenii
raschetnykh formul dlya prigotovleniya bufernykh rastvorov)

PERIODICAL: Nauchnyye doklady vysshey shkoly, Khimiya i khimicheskaya
tekhnologiya, 1958, Nr 3, pp. 482 - 485 (USSR)

ABSTRACT: An experimental checking of the formula

$$p_H = p_K - \lg \frac{c_{\text{acid}}}{c_{\text{salt}}}$$

was carried out by means of phosphate

and acetate buffer solutions. The experimental results obtained
showed that the application of this calculation formula to the
production of phosphate and acetate buffer solutions is possible.
The method for the production of buffer solutions employing
the above mentioned formula is very simple. The deviation
between the p_H value, calculated according to the mentioned
formula, and the experimentally found value is not more than
 $0,1 p_H$. The most exact results are obtained for p_H values when

Card 1/2

On the Problem of the Application of the Calculation
Formula to the Production of Buffer Solutions SOV/156-58-3-19/52

the buffer solution consists of the same concentration of acids and salts (1 : 1, or approximately 1 : 1). By using this formula it is possible to considerably simplify the method for the production of buffer solutions. There are 2 tables and 10 references, 7 of which are Soviet.

TITLE: Theoretical grounds of the spark method of stream visualization

PERIODICAL: Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 8, 1960, 1059 - 1063

TEXT: The aim of the paper is to show that the spark method of visualization of air currents is under certain conditions sufficiently accurate for practical purposes. By the known Stokes formula a burning particle falls down with a velocity

$$v_n = 2/9 \frac{r^2 \gamma}{\mu} \quad (1)$$

X

which is of 0.2 m/sec order. But if the hot air itself moves up with a velocity approaching 0.2 m/sec then the particle is at rest

Card 1/5

26858

S/021/60/000/008/007/011
D210/D305

Theoretical grounds of the ...

relative to the cold air. The author considers two cases: 1) The possibility of soaring of burning particles in the cold air. The equations of motion and conductivity are presented in

$$\rho \frac{dv}{dt} = (\rho_0 - \rho)g \quad (3), \quad \frac{dT}{dt} = D \frac{d^2 T}{dz^2} \quad (4)$$

$$\text{and } \frac{\rho_0}{\rho} = \frac{T}{T_0} \quad (5)$$

with boundary condition for $-\infty < z < a$

$$z = -a \quad T = T_{air}, \quad (6)$$

$$z = -\infty \quad T = T_0, \quad v \approx 0. \quad (7)$$

Introducing new variables $a = z/z$, $v = V/V$, where $V = D/a$, $\Phi = \theta/\delta$ where $\Phi = -D^2/a^3 g$, where $\delta = T/T_0 - 1$ and rewriting the equations

Card 2/5

Theoretical grounds of the ...

26858
S/021/60/000/008/007/011
D210/D305

in the new form, the author obtains the solution:

$$\bar{v} = \bar{v}_{\text{air}} - 0.4(\bar{z} + 1) \quad (12)$$

and

$$\bar{v} = \frac{1.6}{\bar{v}_{\text{air}} - 0.4(\bar{z} + 1)}. \quad (13)$$

The velocity of the particle near to the surface $z = -a$ will be

$$V = 1.6 \sqrt[3]{Dg_{\text{air}}} \quad (14)$$

or $V = 0.18 \text{ m/sec}$, i.e. $V \approx v_{\text{air}}$; this means that a particle with a diameter 10^{-4} m and burning temperature 600°C will be suspended in air, balanced by convective currents. 2) Centrifugal effect of particles with small diameters. If the particle balanced in a vertical direction has angular velocity with respect to the OY axis,

$$F_{cf} = -\rho \omega_0^2 r \tau;$$

Card 3/5

X

26858

Theoretical grounds of the ...

and the air resistance $F_{\text{res}} = - 6\pi a \mu (\bar{V} - \bar{v}_0 \cdot \bar{r})$. By Newton's law it will be therefore $\frac{d\bar{V}}{dt} = \frac{1}{2} - \omega_0^2 \bar{r} - \frac{9}{2} \frac{\mu}{\rho_a^2} (\bar{V} - \bar{v}_0 \cdot \bar{r})$. Introducing x, y coordinates, and new variables

$$\frac{1}{\omega_0} = \frac{t}{\bar{t}}, \quad x_0 = \frac{x}{\bar{x}}, \quad y_0 = \frac{y}{\bar{y}},$$

and

$$\frac{9}{2} \frac{\mu}{\rho_a^2} = - A_1. \quad (20)$$

The equations were transferred to

$$\ddot{x} + A_1 \dot{x} + A_1 \bar{y} = 0 \quad (21), \quad \ddot{y} + A_1 \dot{y} - A_1 \bar{x} = 0 \quad (22)$$

with boundary condition $\bar{x} = 1, \dot{x} = 0, \bar{y} = 0, \dot{y} = 1$ for $t = 0$.

If $A_1 \gg 1$, then $\dot{x} + \bar{y} = 0$ and $\dot{y} - \bar{x} = 0$, or $\ddot{x} + \bar{x} = 0$, and $\ddot{y} + \bar{y} = 0$.

$\bar{x} = 0$, or $\bar{x} = \cos \bar{t}$ and $\bar{y} = \sin \bar{t}$. This means that the particles move in circles or that the full capture of particles by moving air takes place. There are 3 Soviet-bloc references.
