Vrbava, G.

✓Phylogensis of the central regulation of carbohydrate metabolism in muscle. G. Vrbava Českoslov Fysik 4, No. 1, 31-4(1966). Excerpta Med Sect II, 8, 1088(1975). Glycogen was determined either the gastrocnemius or the triceps extensor digitorum longus of both legs in rabbits, guinea pigs, rats, and frogs after one-sided denervation (sciatic nerve). In some animals myelotomy at thoracic vertebrae 4-6 was carried out immediately before denervation. In rabbits, guinea pigs, and rats, muscle glycogen changed equally after denervation or myelotomy. In other words differences in glycogen levels between the innervated and denervated sides disappeared after myelotomy. In frogs, on the other hand, muscle glycogen still increased on the denervated side even after myelotomy. It is concluded that at lower phylogenetic levels the spinal centers suffice to regulate muscle glycogen levels, while at a higher phylogenetic level higher nervous centers are necessary for such regulation. In that sense it is considered possible to speak of "corticization" of metabolic processes. K. L. C.

Title : Recovery of Conditioned Motor Reflexes After Interruption of a Nerve.

Orig Pub: Ceskosl. fysiol., 1956, 5, No 1, 1-12.

Abstract: Reflex spreading of the phalanges of the extremities can be produced in the rat by suddenly interrupting the animal's equilibrium (by removing the support upon which it is leaning). Such an unconditioned stimulus served as reinforcement in the formation of a conditioned response to the sound of a bell. Eight combinations were performed

v

Abs Jour: Ref. Zhur-Biol., No 6, 1958, 27421.

by the emergence of inhibitory processes in the motor analyser within the period of denervation and recovery. When the posterior roots were sectioned at the level of L₁--L₂, the unconditioned reflex remained, but fatigued rapidly. The conditioned reflex was produced with great difficulty, and during its elicitation the phenomenon of extinction took place, the cause of which was the absence of afferent signalization.

Card : 3/3

Carbohydrate Metabolism.

Abs Jour: Ref Zhur-Biol., No 22, 1958, 101616.

Abstract: muscles after RES and physical strain were not noted. After preliminary glucose introduction, the amount of I in the muscles of trained rats was smaller, compared with the control; it remained the same after the infliction of RES. Thus, training removed the changes of adaptive functions of the organism which usually occur after disorders of HNA. -- S. Ya. Marmorshteyn.

Sudden changes in posture or dropping evoke reflex extension of the toes in rats. This unconditioned reflex is absent after the sciatic nerve has been crushed and returns in about 8-12 days. Light or the sound of a bell was used as conditioning stimulus. The conditioned reflex cannot be elaborated during the denervation period. The conditioned reflex present before denervation reappears immediately after reinnervation has occurred, if the reflex was not further worked out during the denervation period. On the other hand, further reinforcement of the reflex during the denervation period leads to disappearance of the reflex after reinnervation is completed. Section of the dorsal roots does not prevent the occurrence of this conditioned reflex. The reflex, however, is very labile and disappears during

5527 CONT

further conditioning. It is concluded that the absence of afferent signals from the extremities causes inhibition to occur in the cerebral cortex. Hahn - Prague

TITLE: Heat accumulator of transport engines

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk, 39. Dvigateli vnutrennogo sgoraniya, no. 1, 1963, 11, abstract 1.39.66 P (Czech. pat., ol. 46c⁴, 15, no. 98623, February 15, 1961)

TEXT: To reduce the cooling of the engine during stops it is suggested to mount on the water duct between the engine and the radiator a heat accumulator containing a low-melting salt. Hot water flowing in the accumulator tubes will melt the salt. During a stop the molten salt will cool down and give the latent melting heat to the water. Four variants of mounting the accumulator are presented. According to one of them, to accelerate the warm-up of the engine at the start, the accumulator is mounted on a branch duct; on the main duct a thermovalve is arranged which closes as soon as the circulating water reaches a given temperature.

(Substance E-25) Against CaCl_2 -Arrhythmia in Rats."

Prague, Casopis Lekaru Ceskych, Vol 102, No 19, 10 May 63; pp 527-531.

Abstract [English summary modified]: Comparative studies reveal that whereas there is a clear antifibrillatory dose-response curve with procainamide, quinidine antifibrillatory effect is relatively independent of dose; effect of "E-25" is 10 to 20 times stronger than that of procainamide and twice stronger than that of quinidine but only at optimal (8 to 10 mg /Kg.) doses; at lower doses it is weaker and at higher doses equal to that of quinidine. Two graphs; 2 Czech and 10 Western references.

Abstract: the insecticides being introduced by various methods in eryphor, propyleneglycol, vegetable oil and various suspensions. I and V proved to be the least toxic. III is less toxic than II, and VI is less toxic than IV. 86% of I is more toxic than 90% I. Propyleneglycol increased and vegetable oil decreased the toxicity of insecticides. A rise in the sensitivity to phosphoro-organic insecticides was observed at their repeated introduction. Bibliography with 33 titles.

"Hyponatremia in Diseases of the Heart"

Belgrade, Srpski arhiv za celokupno lekarstvo, Vol 93, No 9
Sep 65, pp 823-829.

Abstract: The author found that hyponatremia can be the most obvious sign of complex humoral disturbance in cardiac cases. Many patients with hyponatremia have increased body sodium and water and hyponatremia represents a disturbed relationship between the water and sodium content in the serum. This disturbance can be temporary, but if it begins during serious cardiac weakness it is probably a consequence of cellular disturbances caused by anoxia. Therapy is basically the same as for any other difficult cardiac insufficiency and is directed toward improved function of the myocardium and easing of circulation. Supplementary therapy includes restriction of liquids and administration of potassium and pronison. 1 Yugoslav, 13 western references.

TITLE: Problem of late sequellae of poisoning with organophosphate insecticides

SOURCE: Ceskoslovenska neurologie, no. 3, 1965, 220-223

TOPIC TAGS: insecticide, toxicology, biochemistry, organic phosphorus compound, neurology, biologic metabolism, nervous system

ABSTRACT:
 Insecticides containing compounds of organic phosphorus damage the periphery of the nervous system in humans because they act on neuro-muscular plates, vegetative ganglia, CNS, and the brain. Study of 398 people who worked with these insecticides showed the possibility of the occurrence of late sequellae. Pseudoneurasthenic syndromes were found. The organic P compounds affect the cholinesterase complex, and possibly hydrolysing ferments, and glycolysis and phosphorylation of serines. Myeline metabolism may be damaged permanently. TITLE: "Electrotechnical Products at the 1961 Brno International Fair"

SOURCE: Prague, Elektrotechnik, Vol XVI, No 9 (Sept 61) p 246-256

DESCRIPTION: This is an illustrated description of Czechoslovak (and of a few foreign) products which were exhibited at the Third International Fair at Brno. The products prove the high level of electrotechnics in Czechoslovakia. They are arranged by producers such as the V. I. Lenin Factories in Plzen, the CKD of Prague, etc., and include electric equipments of a great variety, such as commutator tri-phase shunt motors, valve lightning arrester, welding automat, explosion-proof coupling for armored cables, etc.
