Walkowski, Z. Preliminary Estimate for Oxygen and Acetylene Supply Scheme for Major Works.

„Przykład wstępnego obliczenia do projektu zapotrzenia większych zakładów w tlen i acetylen”. Przegląd Spawalnictwa, No. 7-8, 1951, pp. 162-164.

The monthly oxygen requirements will, in the case of a performance involving 25000 superficial meters of machine cuttings, a similar amount of manual cutting, 5000 meters of oxy-acetylene welding and 7000 meters of preheating, and allowing for a mean thickness of 15 mm, amount to 15,000 m<sup>3</sup>, or to the equivalent of 100 bottles of oxygen per diem. Supply by motor transport or pile line. Remunerability of erecting a special oxygen factory at the works. Oxygen distribution system inside the works. Adoption of liquid oxygen, which is more expensive than oxygen gas. Acetylene demand — 5600 m<sup>3</sup>, or at the rate of 25 m<sup>3</sup> per hour, requiring 6 generators with an output of 7.5 m<sup>3</sup>/H each, plus 6 stand-by sets; pressure — 1.5 atm. Plan of the acetylene production plant. Acetylene distribution system. The use of dissolved acetylene.

TITLE: Features of the continuous emission of a plasma

SOURCE: Ceskoslovenska akademie ved. Astronomicky ustav. Publikace, no. 51, 1965. 3rd Consultation on Solar Physics and Hydromagnetics, Tatranska Lomnica, 13-16 October 1964, 145-154

TOPIC TAGS: solar activity, solar radio emission, electron, electromagnetic wave, solar plasma, kinetic energy, magnetic energy, satellite

ABSTRACT: The author describes present shortcomings in the study of plasma and mentions recent measurements of plasma emission and new satellite observations of the ionosphere. Cases where the magnetoionic theory is not comprehensive enough are mentioned. Some conclusions are derived concerning the continuous radio emission from the active regions of the sun. Resonances of the harmonics of the gyrofrequency.

Card 1/2

L 46807-66

ACC NR: AT6020514

are measured in plasma emissions, and resonances on ionograms made from satellites are studied and interpreted theoretically. Previous works on the kinetic background of the model are mentioned. The influence of magnetic fields on the continuous radio emission of solar active regions is discussed. To overcome the discrepancy between the observed gyroharmonics and their absence in the magneto-ionic theory, that is in the hydromagnetic approximation for a cold plasma, the thermal motion of the electrons must be included in the calculation of the dielectric behavior of the magnetized plasma. Figures appearing in the original article show how the curves for the refractive index must be modified in the simplest case of propagation perpendicular to the magnetic field. Two possible solutions are given. The author concludes that the magnetic influence on the generation and propagation of electromagnetic waves is mainly concentrated on the lower harmonics of the gyro-frequency. Radiation must then originate at levels where the kinetic energy is far lower than the magnetic energy. If this cannot be accepted, essential spectral peculiarities, explained by a kinetic dispersion relationship for electromagnetic waves must exist at higher harmonics. The levels are indicated beyond which the magnetoionic method can no longer be used. Orig. art. has: 4 figures and 7 formulas. [GC]

✓ Sulfidization in boiling sulfur of silver-copper alloys. Luchin, Czerwik, Stanislaw, Mironcc, Krystyna, Wallisch, and Teodor Werber (Akad. Górniczo-Hutnicza, Kraków, Poland). *Arch. Hutnicza* 3, 140-54 (1958) (English summary).—Ag-Cu alloys of different compas. were etched with dil. HNO<sub>3</sub> and sulfidized in boiling S (C.A. 52, 2714g). The wt. increase per unit area, or its square, increased linearly with time for alloys contg. Cu 1-50 or 75-90%. Within 50-75% of Cu, a gradual transition from the linear to the parabolic law was observed. Marking expts. with Pt wire touching the sample surface, diam. 0.07 mm., microscopic observations, and chem. analysis showed that the homogeneous scale is a Ag<sub>2</sub>S-Cu<sub>2</sub>S solid soln. of greater Ag content nearer the scale/S boundary. It is formed in outward metal diffusion. In Cu-rich alloys, the rate of sulfidization was roughly the same as in pure Cu, in agreement with Wagner-Hauffe theory (Hauffe, *Oxidation von Metallen u. Metalllegierungen*, 1956 (C.A. 51, 4921e)). A lack of analogy between oxidation and sulfidization is stressed. I. Stecki

AUTHORS: Mrowec, Stanisław, Wallisch, Krystyna and Werber, Teodor

TITLE: Kinetics and mechanism of the reaction between sulphur and silver-zinc alloys

PERIODICAL: Archiwum hutnictwa, v.5, no. 4, 1960, 323-344

TEXT: The authors investigate the kinetics of sulphurization of Ag-Zn alloys containing from 6.0 to 68.5% of zinc. The rate of the sulphurization was measured by the balance method. Rate measurements were carried out for the whole concentration range of the investigated alloys at the temperature of 444°C. For four selected compositions the authors also investigated the relation between sulphurization rate and reaction temperature within the range of from 300 to 444°C. It was stated that the sulphurization process of the low-percentage alloys (up to 26.1% at Zn) occurs according to the parabolic law. The values for the parabolic constants are given in Tables 1 and 2. It was found that with the increasing concentration of zinc in the alloy, the rate of sulphurization decreases

Card 1/6

✓

according to the relation given by Czarski, Mrowec and Werber in Reference 3 "Archiwum hutnictwa PAN, 3, 1959, 245", where

$$k'' = A e^{-BN} \quad (17)$$

where  $k''$  - parabolic constant, A and B - empirical constants, N - concentration of zinc in the alloy in molar fractions. Similar to the case of sulphurization of Cu-Al and Cu-Zn alloys, several ranges of zinc concentrations in the alloy with different values of the empirical constants A and B in the 17, were found. The change in the values of the constants A and B in Eq. 17 relates to a change of the energy of activation of the sulphurization process. The values for the activation energy are given in Table 3. The sulphurization process of alloys containing from 35.2 up to 68.5% at.Zn occurs according to the logarithmic law, but the sulphurization rate practically does not depend on the concentration of zinc in the alloy. The scale formed on low-percentage alloys, up to 26.1% at.Zn, consists of two layers. The external one is homogeneous and consists of  $\alpha$  -  $Ag_2S$ , the internal layer is a heterophase mixture of sulphides  $\alpha$  -  $Ag_2S$  and  $\beta$  -  $ZnS$ . Investiga-

tions carried out by the marking method proved that the "marker" is always on the boundary of both scale layers. Investigations concerning the rate of growth of the external scale layer have demonstrated, that the growth of this layer and the growth of the whole scale occur according to the parabolic law. The authors express their thanks to Professor, Doctor Lucjan Czerski who guided and evaluated this work. There are 5 tables, 12 figures and 27 references: 16 Soviet-bloc and 11 non-Soviet-bloc.

TITLE : Investigation of the Mechanism of the Tarnishing  
of Silver in Liquid Sulfur  
ORIG. PUB. : Arch Hutn, 3, No 1, 49-58 (1958)  
ABSTRACT : The authors have applied the gravimetric method  
to the investigation of the kinetics of the  
tarnishing of silver (99.95% Ag) in liquid sulfur  
at 220-444°. The quantity of Ag which reacts  
is a linear function of the time, indicating that  
the rate of tarnishing is determined by the reac-  
tion at the liquid-solid interface. The energy  
of activation for the reaction is 15,500 kcal/mol  
at 220-300° and 5,250 kcal/mol at 300-444°. The  
composition of the reaction product varies slightly
