Title : Epizootiological Study of the Infectious Encephalo-
myelitis Outbreak Among Silver Foxes.

Orig Pub: Studii si cercetari infranicrobiol., microbiol. si
parazitol. Acad. RPR, 1956, 7, No 1-2, 101-110.

Abstract: The outbreak of infectious encephalomyelitis in foxes caused an extensive epizooty among the animals, especially among the young ones in the age group of 1-3 months. Vectors and distributors of the infection were probably adult foxes who have recovered from the disease. A virus was extracted from one of the sick

foxes after his death. By means of serial subarachnoidal inoculations of the extracted virus to dogs (15 to 46 day old puppies), it was possible to adapt it to their nervous system. After 6 subinoculations, infection and death were caused by the inoculations in 100 percent of the puppies. The clinical and pathologic-anatomical characteristics of the process described above correspond to the characteristics of infectious hepatitis in dogs which have been described by Rubart.

Aueski Disease Data.

Orig Pub: Studii i cercetari inframicrobiol., microbiol. i parazitol.
Acad. RPR, 1956, 7, No 3-4, 355-402.

Abstract: The authors have established the fact that the epizooty
process of the Aueski disease in dogs and cats of Bucha-
rest was caused by raw pork used as food constituting
the source of the disease. When experimental animals
were inoculated with the ground lung tissue obtained

Card : 1/3

from just slaughtered healthy pigs, 71.4 percent of them fell sick and secreted viruses. When two strains of the Aueski virus were used in intracerebral inoculations of mice, they caused the animals to become sick (encephalitic syndrome and itch), beginning with the third subinoculation 6 hours after incubation, and after 8 to 16 hours, death of the animals followed. Hematological examination revealed that the afflicted animals are perpetually suffering from leucocytosis. The leucocytic formula was characterized by neutrophilia (88.8 to 92.8 percent), lymphopenia (4.7 to 8.2 percent), eosinophilia and basophilia, as well as the presence of plasmacytic type cells and changes of the polynuclears and

of the monocytes. The following changes were predominant in the pathological and anatomical changes of the sick animals: hemorrhagic diathesis, hepatitis, acute nephritis, myocarditis, nonpurulent lesions of the meninges and of the brain, degenerative cytonuclearic lesions of the sympathetic modules with Hurst's intranuclear inclusion as well as neurophagic processes.

changes of neurones. In 35 cadavers of dog pups the following was observed: anemia, icteric discoloration of sclerae and mucosa of the palate, exudates of the cavities, hepatitis and perihepatitis, hemorrhages, cellular infiltrations, as well as trophic lesions in all organs. The changes in the central nervous system were similar to those in foxes.

Sulfonic acids from hydrocarbons of Fischer-Tropsch synthesis. I. Kowalski and H. Weghofer, Przemysl

Chem. 9, 133-41 (1955) English summary. Sulfonic acids of aliphatic and alicyclic hydrocarbons were obtained in presence of a halogen, especially Cl, as a catalyst. In an autoclave with stirrer were placed 100 g. paraffinic hydrocarbons from cobaltic Fischer-Tropsch synthesis, 50 g. SO₂ (I), and 1.5 g. Cl (II). N was introduced to obtain 8 atm., followed by O to obtain 15 atm., and the mixt. was heated at 45°; the reaction was recognized by the drop of pressure. To keep 15 atm., more O was introduced. After 3 hrs., 70 g. of Na salt of sulfonic acids (III) was obtained. The use of 100 g. I under the same conditions yielded 112 g. III. The use of O did, with neutral gases, give a more valuable end-product. The sulfonic acids were also obtained by the action of (1) I and O in hexane in ultraviolet light (III) was purified with 5 parts of bleaching alkali at 40°; (2) I and air in the presence of II (III purified with KMnO₄); (3) I and II on butanol (purification with 10 parts Cl water at 35°); (4) I and air, activated with II, on the fraction b: 230-320° of the Fischer-Tropsch synthesis (III sept. from hydrocarbons with 3 parts H₂O); and (5) I; air, and ultraviolet light on the fraction b: 20-320° (III sept. from hydrocarbons with 5 parts MeOH).

Title : The Production Yield in Carbonization Wherin a Tamping of the Charge is Employed.

Orig Pub: Koks, smola, gaz, 1957, 2, No 6, 267-273.

Abstract: The material balances are compared which are concerned with the work of the by-product coke plant which has two operating systems of coke ovens:

- a) content of volatile matter in a charge was 29.1%, carbonization time 23 hours 29 minutes,
- b) 28.0% and 21 hours 33 minutes respectively.

Card 1/2

POLAND / Chemical Technology. Processing of Solid Fossil Fuels. H-22

Abs Jour: Ref Zhur-Khimika, No 23, 1958, 78998.

Abstract: It was found that in system (b) the coke yield increased from 73.7% to 74.7%; that fact was explained by a decrease in volatile matter. In system (b) the yield of tar declined by (11%), the gas yield increased (by 4.5%) and the yield of benzene increased (by 10.6%). A shortening of carbonization time in the system (b) caused a lowering in the yield of dry coke 40 millimeter size by 2.7% and its 10-20 millimeter fractions by 7%. The nature of the coke gas also changed: its caloric value decreased by 1.48%, the CH_4 content decreased by 3.67%, the CO content increased by 8.39%, the content of free C in tar increased by 25.11% and that in pitch by 5.13%.

Showed that: 1/ the CR in distilled water was considerably greater than in tap water; 2/ an addition of 4% of I to water of both descriptions reduced the CR ten times; 3/ the CR and the inhibiting action of I manifested themselves in different ways in solutions of CaSO_4 , CaCl_2 and $\text{Ca}(\text{OH})_2$. The greatest inhibition was observed in CaSO_4 solution; 4/ the curves describing CR - duration of tests (40 days) were of the step line type in all cases. The determination of the change of the P with time showed that a deterioration of the P took place in solutions of 0.1% of NaCl, 0.1% of KCl, 0.1% of CaCl_2 , 1% of MgSO_4 , 0.1% of CaHCO_3 and in the aqueous extract from peat. Should 4% of I be

added to these solutions, the P of the specimens would improve with time and the CR would be very little. It is assumed that the inhibition of the CR in water and the majority of salt solutions at the addition of I to them is caused by the hydrolysis of the latter and by the alkalinity rise of the solutions.

WEGIERKO Jakub

WEGIERKO J. III Klin. Chorób Wewn. Akad. Med., Warszawa. "Typowy zespół objawów klinicznych u chorych na cukrzycę zakonczony śmiercią w śpiączce bez zakwaszenia ketonowego ('trzecia śpiączka'). Typical syndrome in diabetic patients ending with death in coma without the ketonic acidemia ending with death in coma." LEK. 1956, 11/48 (2020-2023) Graphs 1

Seven cases of a typical syndrome of psychic symptoms ending with death in coma without the ketonic acidemia in patients with diabetes were observed. The reaction to insulin was rather mild. In no case was a tendency to ketosis observed. The diabetes on the whole was rather mild. The diabetes had always been present for some time when the depression developed; the patients avoided persons from their environment; there appeared hallucinations, restlessness, marked insomnia, aversion to food and vomiting. Later on the insomnia passed usually into sleepiness, finally coma appeared leading to death. The author is of the opinion that it was a special form of diabetes in which coma appeared due neither to the ketonic acidemia, nor to hypoglycaemia, but as a result of the localization of lesions in the vicinity of the hypothalamus (by the author called 'third coma'). At necropsy only in 2 cases were very inconsiderable sclerotic lesions found in the cerebral vessels; such lesions as are found were usually in older persons: the third case concerned a 41-year-old individual. The author states that although there are no sufficient proofs that these symptoms form a strictly defined syndrome connected with the course of diabetes, nevertheless a characteristic symptom, both concerning the sufficiently defined, persistently and repeated analogical symptoms, is a sufficient reason for discussing this problem.

✓ 6236. Rate of metabolism in Tardigrades during active life and anaphysis. A. Pigoń and B. Weglarska. *Nature, Lond.*, 1955, 176, 127-128 (Dept. of Coll. P. ANAT., Dept. of Zool., Jagiellonian Univ., Cracow).—The oxygen consumption of two species of *Macrobiotus*, stages of *M. dispar* and *M. hufelandi* was measured in the Clatesian diver microgasometer. For the active stage of *M. dispar* the O_2 consumption was 1600 and $980 \mu\text{l.} \times 10^{-4}/\text{hr./individual}$ respectively. In the encysted form of *M. dispar* the O_2 consumed was $240 \mu\text{l.} \times 10^{-4}/\text{hr./individual}$. In the encysted form of *M. hufelandi* true anaphysis appeared to take place with an O_2 uptake of $1.6 \mu\text{l.} \times 10^{-4}/\text{hr./individual}$. There was a logarithmic increase in the metabolic rate with increase in humidity of the atmosphere in the dried form of *M. hufelandi*.

ACCESSION NR: AP5019800	PO/0084/65/000/007/0019/0020
AUTHOR: Sztajerwald, J. (Engineer); Baniukiewicz, E.; Stepiak, S.; Weglewski, J. (Engineers); Stanowski, Z. (Master engineer)	
TITLE: Ionic fire prevention sensor	
SOURCE: Przeglad pozarniczy, No. 7, 1965, 19-20	
TOPIC TAGS: fire prevention, fire alarm, ionic fire sensor	
ABSTRACT: The article describes an ionic sensor for detecting the outbreak of a fire for which a Polish patent (Patent No. 43-177 Clasa 74a, 30) was issued on Sept. 22, 1958. The owner of the patent is the Państwowe Przedsiebiorstwo Poczta Polska, Telegraf i Telefon (Polish State Postal, Telegraph, and Telephone Service) in Warsaw. The sensor is activated during the very early stage of a fire by the presence of minimal quantities of foreign matter in the air, such as smoke, dust, and city gas. When activated, the device immediately disconnects the electric power supply to the malfunctioning apparatus, thus preventing the outbreak of a fire. At the same time, the device can raise the alarm or start air ventilation to cool the defective apparatus. Fig. 1 of the Enclosure shows the schematic of the device, which consists of a diode sensor connected through three conductors (of any length) to a one-stage DC amplifier and the signalling circuit. The cathodes	
Card 1/3	

ACCESSION NR: AP5019800

of the diode sensor is a very thin platinum wire and the anode is made of plates or a spiral. The diode sensor is located in the air stream flowing from the apparatus under control. The cathode is heated to a certain fixed potential. Resistor R_2 controls the device sensitivity. Any change in the cathode temperature (e.g., due to the burning of fine particles or some gases in the air stream) immediately changes the diode current and thus energizes the device. Orig. u.t. has: 1 figure.

Title : Crystal Structure of Zirconium Arsenides

Orig Pub : Roczn. Chem., 1956, Vol 30, No 1, 353-354 (published in Polish with a summary in English)

Abstract : Radiography has been applied to the investigation of Zr-As system over the composition range 30-70 atom percent As. Two phases were found: ZrAs and ZrAs₂. ZrAs is isomorphic with TiAs (RZhKhim, 1955, 42446).² Values for the lattice parameters of ZrAs_{1.95} (a=3.80₄, c=12.86₇Å) and for Zr₂TiAs_{1.95} (a 3.73 with 12.43Å). It has been established that ZrAs₂ has rhombic symmetry and belongs to space groups Pnam or Pna₂₁ with lattice parameters a 6.80₄, c 3.68₉, b 9.02₇ Å, Z = 3.97.

Electron diffraction, diffractograph, and its application in research work. L. Wegmann. *Minicht Listy* 5, 397-406 (1930).--Electron diffraction phenomena follow the same laws as diffraction of x-rays; it is therefore possible to determine the shape of crystal lattices by electron diffraction. The basic laws are briefly discussed and the arguments are amplified by comparative pictures obtained with an electron microscope and a diffractograph. A description of a diffractograph produced by Trük, Thüber & Co., Zürich, is given. Many problems difficult to study by x-ray equipment can be conveniently investigated by electron diffraction. The diffractograph is suitable for analysis of very thin layers in chem. microanalysis, and also in optics where layers of a thickness of the order of $\frac{1}{10}$ or $\frac{1}{100}$ of the wave length of light are involved. A particularly useful application of electron diffraction is to the study of the surface condition and finish of metallic and non-metallic specimens. B. G.

Wegener H.

Stampings from Brittle Metals and Alloys. M. Schneider and
V. Verner. Proc. Inst. Mech. Eng., 1957, 6, (20), 12-17. [In Polish].
S. and W. studied the possibility of using as-cast 70:30 brass for
the stamping of thin-walled cups. According to the equation
 $\sigma_3 < \sigma_1 = \sigma_2 < 0$, where σ_1, σ_2 are the stresses in three dimensions,
it is possible by suitable increase of the stresses to change brittle
material into a plastic form. This offers economic advantages,
since rolling of the blanks is eliminated, and it becomes possible
to form the splices from suitably cut ingots. Stampings from
blanks 29.8 mm. in dia. \times 15 mm., cut from a round ingot bar,
possess good surface quality and microstructure. Cups drawn
from the stampings possess good characteristics; hardness dis-
tribution is uniform throughout, and ranges from 150 to 160
kg./mm.². Ref.—A. W.
