779. SYSTEMIC AND LOCAL USE OF SULPHONAMIDES IN THE TREATMENT OF TRACHOMA (Russian text) - Ershkovich A.I. - ZH. OFTALM. 1956, 5 (293-294)

Two groups of children with uncomplicated trachoma (30 in each) were under observation. The ages ranged from 3 to 15 yr. One group was treated with sulphonamides locally, and the other both locally and systemically. For local instillation a 30% solution of albucid (5 times a day) was used and sulphidine (sulphapyridine) ointment was used for massage. White streptomycin was given in doses of 0.04-0.05 g./kg. body weight per day. The whole course of treatment consisted of 5 cycles each made up of 5 days' streptomycin medication and 3 days' interval. The trachomatous process responded to treatment equally rapidly in both groups. No particular difference with respect to effectiveness of treatment could be noted in the 2 groups of patients and it is therefore recommended that in uncomplicated trachoma topical 30% albucid be used alone. TITLE:

Angular anisotropy of radiation in the
Van Allen belts of the earth

PERIODICAL:

Akademiya nauk SSSR. Izvestiya. Seriya
geofizicheskaya, no. 10, 1962, 1441-1445

TEXT:

The published work on the various types
of angular distributions of charged particles in the Van Allen
(radiation) belts is reviewed. It is shown that the degree and
the nature of the anisotropy of the particle distribution are
not constant in space (they vary away from the earth) or in time
(quiet periods or disturbances). The possibility of the appearance
of unstable plasma in the upper atmosphere, related to the strong
anisotropy of the angular distribution of electrons, is discussed.
There are 2 figures.

TITLE: On the possibility of heating of the upper atmosphere by hydromagnetic waves

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya geofizicheskaya, no. 3, 1963, 487-492

TEXT: The analysis is confined to the propagation of waves of small amplitude along the geomagnetic field, using the dispersion relation derived by Ginsburg on the quasi-hydrodynamic approximation. It is shown that for hydromagnetic waves with periods between 0.1 sec. and 5 min., the dissipation of such waves may contribute significantly to the heating of the atmosphere at heights of 200 - 400 km, provided the wave amplitude above the ionosphere is of the order of 100 γ . The maximum power is liberated at heights at which the ion-molecule collision frequency is comparable with the pulsance of the hydromagnetic

On the possibility...

wave. This is illustrated in the figure in which the power dissipation in $\text{erg/cm}^3 \text{sec.}$ is plotted as a function of height in km for periods of 0.1, 1, and 10 sec. respectively (curves a, b, and c). The amplitude of the wave is assumed to be $h_0 = 100 \gamma$. It is emphasized that a detailed solution of the problem will only become possible when experimental data for the oscillations above the ionosphere become available. Micro-pulsation data provide only incomplete information. There is 1 figure and 2 tables.

AUTHOR: Yershkovich, A. I.

TITLE: X rays in aurora bands

SOURCE: Geomagnetizm i aeronomiya, v. 4, no. 2, 1964, 412-414

TOPIC TAGS: x ray, aurora, aurora band, planetary magnetic moment, planetary magnetic field

ABSTRACT: X-rays originating in the aurora bands are generated by collisions between fast electrons and particles of the upper atmosphere. During strong aurora the intensity of this radiation

and can be as much as $0.1 \text{ erg/cm}^2\text{-sec}$. The intensity at a point P lying on the geomagnetic latitude λ at a geocentric distance of r earth radii is

$$I(r, \lambda) = \frac{\Omega(r, \lambda)}{4\pi} I_0$$

Card 1/3

ACCESSION NR: APL031649

$$= \frac{I_0}{2\pi} \frac{\cos \lambda_0 d\lambda_0}{r^2} (\varphi_1 \sin \lambda_0 \sin \lambda + \cos \lambda_0 \cos \lambda \sin \varphi_1)$$

where Ω is the solid angle subtended by the aurora band visible at P. For the earth the angular width of the aurora band $d\lambda_0$ is about 15° and the geomagnetic latitude of the maximum λ_0 is about 67.5° . Here ϕ_1 and $2\pi - \phi_1$ are the longitudes of the intersection points of the geomagnetic parallel λ_0 and the profile circle, which is defined as the circle bounding the portion of the earth's surface visible from P. If λ is such that all points lying on the parallel λ_0 are visible from P, then ϕ_1 is set equal to π . Otherwise ϕ_1 is given by the expression

$$\cos \varphi_1 = \frac{r^{-1} - \sin \lambda_0 \sin \lambda}{\cos \lambda_0 \cos \lambda}$$

It is noted that the magnetic moment of a planet is given by the relation

$$M = (8\pi\rho_R)^{1/2} \frac{R^2 v_R}{\cos^2 \lambda_0}$$

Card 2/3

ACCESSION NR: APL031649

where R is the radius of the planet, ρ_k is the corpuscular flux density, and v_k is its velocity. Thus, if the magnetic field of a planet can not be measured directly by using a magnetometer, it can be estimated from the observed spatial distribution of the radiation intensity $I(r, \lambda)$ from which λ_0 can be evaluated.

TITLE: Spectrum of very high-energy electrons generated during the beta decay of albedo neutrons

SOURCE: Kosmicheskiye izlucheniya, v. 2, no. 5, 1964, pp. 782

TOPIC TAGS: electron, albedo neutron, beta decay, radiation belt, electron energy spectrum

ABSTRACT: The author has calculated the equilibrium integral spectrum of beta electrons in the radiation belt of the center of several Mev, and shown that it agrees with the experimental results obtained in the outer radiation belt. It is noted that electrons with energy E of the order of several Mev were detected as the cosmic radiation in the vicinity of the first and second Soviet space rockets. It has been pointed out that these electrons are generated during the beta decay of albedo neutrons with energies of hundreds and thousands of Mev. On the basis of an analysis of such data, the author has determined the principal process determining the lifetime T of electrons in the energy 10-100 Mev associated with Coulomb interactions with particles in the exosphere. If N is the concentration of gold plasma of the exosphere, the ionization losses of ultrarelativistic electrons ($E \gg m_0 c^2$) are

and 1/4

L 11363-65

$$-(dE/dt)_1 = 7.82 \cdot 10^{-4} N \cdot$$

$$\cdot (\ln E/mc^2 - \ln A +$$

$$+ 73.4) \text{ ev} \cdot \text{sec}^{-1} \quad (1)$$

From this relation and others cited in the article it follows that the equatorial value of the flux of trapped beta-decay electrons when $r^2 \gg 1$ is proportional to $1/r^4 N(r)$. Fig. 1 of the Enclosure shows the integral spectrum of beta electrons in the region of the maximum of the outer radiation belt ($r \approx 4$). N is assigned a value $2.9 \cdot 10^4 \text{ cm}^{-3}$. When $E \gg 1.5 \text{ Mev}$ this spectrum is approximately proportional to $E^{-2.5}$, which is in good agreement with measurements made on the satellite Explorer XII. The ratio of dN/dE to dN/dE ($E \geq 5 \text{ Mev}$) in the outer belt is approximately 10^2 with a change of geocentric distance r from 15,000 to 55,000 km. This is a value close to the constant 10^2 found in the Enclosure. This and other published data support the hypothesis that very high-energy electrons in the radiation belts are generated during the beta decay of albedo neutrons. The effect of the beta-rain mechanism can cause considerable variations in the

TITLE: Formation of radiation belts as a result of particle drift deep into the magnetosphere

SOURCE: Vsesoyuznaya konferentsiya po fizike kosmicheskogo prostranstva. Moscow, 1965. Issledovaniya kosmicheskogo prostranstva (Space research), trudy konferentsii. Moscow, Izd-vo Nauka, 1965, 326-334

TOPIC TAGS: radiation belt, neutron albedo, geomagnetism, particle production

ABSTRACT: Measurements made by the "Relay-1" satellite indicate that the intensity of trapped protons with energies greater than 34 Mev varies during magnetic storms as if the particles were drifting toward the earth. The authors consider two mechanisms which may be responsible for such a drift: 1) deviation of the third invariant due to a sudden change in the amplitude symmetry of the geomagnetic field with subsequent gradual restoration and 2) the action of hydromagnetic waves. Assuming that the first and second invariants remain constant during particle drift, the

Card 1/3

L 1283-66

ACCESSION NR: AT5023601

betatron mechanism is responsible for motion of the particles to magnetic shells with lower McIlwain L parameters. To determine the spatial distribution of particle intensity, an equation of continuity must be solved, assigning definite mechanisms for particle production and annihilation. The authors evaluate the effectiveness of the albedo neutron source, assuming for simplicity that particle drift to shell L_1 takes place instantaneously. It is found that the albedo neutron source cannot be of considerable importance in formation of the Davis protonosphere. However, this source may be responsible for the relativistic electron belt. If electron drift toward the earth is fast enough, the albedo neutron source may cause the observed intensity of relativistic electrons within a time much less than the lifetimes as determined by ionization losses. Since the power of the neutron source was found to be insufficient for the observed proton intensity, the authors evaluate the effect of proton drift toward the earth from the layer between the magnetosphere and the leading edge of the standing shock wave. A comparison of experimental and theoretical results shows that the proton drift source may be responsible for the observed intensity in the proton belt. It is pointed out that drift of solar protons with energies of the order of a few hundred kev to magnetic shells with $L \sim 1.5$ may be responsible for a certain number of high-energy protons in the inner belt. However, evaluation of this source requires spectral measurements of solar protons with

Card 2/3

TITLE: Concerning the anomalous diffusion of charged particles in the magnetosphere of the Earth

SOURCE: Kosmicheskiye issledovaniya, v. 4, no. 5, 1966, 788-790

TOPIC TAGS: earth magnetic field, space charge density

ABSTRACT: V. A. Tverskoy (see his Issledovaniya kosmicheskogo prostranstva - Investigations of cosmic space, Publ. House "Nauka", 1965) derived the basic equation for the transfer of charged particles across the drift shells of the magnetic field of the earth under the action of azimuthally asymmetric magnetic pulse-like perturbations. The present author applies this theory to protons of energy over 0.1 Mev and compares the results with the experimentally measured proton intensities obtained by the Explorer 12. There are systematic deviations between the theoretical and experimental data. Orig. art. has: 1 figure and 8 equations.

TITLE: Motion of charged particles in the vicinity of the neutral point

SOURCE: Kosmicheskiye issledovaniya , v. 4, no. 3, 1966, 378-393

TOPIC TAGS: magnetic field, solar wind, magnetosphere, particle trajectory, asymptotic property, CHARGED PARTICLE, EARTH MAGNETIC FIELD

ABSTRACT: The motion of charged particles in the vicinity of neutral points is discussed, using two- and three-dimensional models. The neutral point is shown to be a regular singularity in the magnetic field and exists on the boundaries of the magnetosphere where the solar wind interacts with the geomagnetic field. Two types of fields are considered:

$$H_x = -2Ax, \quad H_y = -2Ay, \quad H_z = 4Az,$$

and

$$H_x = -2Ax, \quad H_y = 0, \quad H_z = 2Az.$$

The orbits of charged particles are calculated first in the two-dimensional field where exact solutions are obtained for several special cases. The three-dimensional case is analyzed by using the Volosov recurrence method. The equations

Card 1/2

ACC NR: AP6019591

2

$$\begin{aligned}\ddot{x} &= \omega_y \dot{y} - \omega_z \dot{z}, \\ \ddot{y} &= -\omega_x \dot{x} + \omega_z \dot{z}, \\ \ddot{z} &= \omega_y \dot{x} - \omega_x \dot{y},\end{aligned}$$

$$\omega_x = \frac{eH_x}{mc}, \quad \omega_y = \frac{eH_y}{mc}, \quad \omega_z = \frac{eH_z}{mc}$$

are solved asymptotically by assuming

$$\begin{aligned}\omega_x &= e^{n+1}\omega_1, \quad \omega_y = e^{n+1}\omega_2, \quad \omega_z = e^n\omega_3, \\ \omega_1 \sim \omega_2 \sim \omega_3 &\sim 1, \quad \varepsilon \ll 1.\end{aligned}$$

For each magnetic field the reflection boundaries are calculated, the conditions of hose instability determined, and two mechanisms are proposed for particle penetration into the magnetosphere. The authors express gratitude to V. P. Shalimov and L. S. Chesalin for evaluating this work. Orig. art. has: 3 figures and 64 formulas. [04]

TITLE: Rolling of ASM alloy-clad steel with an aluminum insert

SOURCE: Tsvetnyye metally, no. 10, 1966, 68-70

TOPIC TAGS: *flat plate, sheet metal, metal* aluminum alloy, *metal rolling, low carbon* cladding, *aluminum,* metal rolling/ASM alloy steel, clad

ABSTRACT: The effect of antimony content in the ASM alloy (3.5—6.5% Sb, 0.3—0.7% Mg, 0.3—0.7% Fe, 0.3—0.5% Si, Al-balance) on bond strength between the alloy cladding and a low-carbon steel base has been investigated. Low-carbon steel plate was clad with pure aluminum or alloys containing up to 8% antimony. It was found that the bond strength between pure aluminum and steel reached 6.4 kg/mm²; it was reduced to 6.0 kg/mm² in the case of alloy containing 2% antimony, and 3.0 kg/mm² in alloy with 8% antimony. The steel-ASM alloy interface contained numerous brittle crystals of AlSb compound, which caused a separation of cladding. To eliminate the effect of antimony and other alloying elements on bond strength, the cladding was done with an aluminum inter-

Card 1/2 UDC: 669-419.4:621.771

AP6033617

layer. In practice, the machined ASM alloy ingots are pack-rolled with A6 aluminum sheets 3 mm thick at 500—540C in eight passes with reduction from 136 to 8 mm, then cold rolled to the required thickness. The cold-rolled sheets are then used as cladding material for steel. Orig. art. has: 2 figures.

Resistance of an electrolyte in a bath with several cylindrical electrodes. A. D. Kirshov and V. S. Afoshin. *Zhur. Priklad. Khim.* (J. Appl. Chem.) 24, 1210-12 (1951). The problem of current and potential distribution in a bath with a central cylindrical anode and a no. n of cylindrical cathodes disposed around it is treated by analogy to the corresponding electrostatic problem. A complicated formula is obtained for the elec. resistance of the system in terms of n , the conductivity of the electrolyte, the radii of the anode and the cathodes, and the distances. The resistance depends mainly on the radius of the anode and the anode-cathode distance, less on n and the radius of the cathodes. Practically, the resistance of such a system is not very much different from the resistance of a system of 2 coaxial cylindrical electrodes.

lidze)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1957,
12. pp 109-110 (USSR)

ABSTRACT: Professor Aleksandr Antonovich Tvalchrelidze died on 29
July 1957 at the age of 76. He was a prominent scientist,
actual member of the Academy of Sciences of the Georgian SSR,
director of the Caucasian Institute for Mineral Resources of
the Ministry of Geology and Conservation of Natural Resources,
chairman of the council for study of power resources of the
Academy of Sciences of the Georgian SSR and Head of the Chair
for Mineralogy and Petrography at the State University of
Tbilisi.

AUTHORS: Yershov, A.G. and Sizov, Ye. S.

TITLE: Analysis of the Process of Bending, with Simultaneous Beveling, of Extruded Profiles by Forcing Through a Die

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Aviatsionnaya tekhnika, 1960, Nr 1, pp 146-153 (USSR)

ABSTRACT: Simultaneous bending and beveling of profiles in a single die has been introduced to avoid the need for large dies otherwise required to calibrate the diameter and bevel the flange in making ring frames from profiles with large sizes of the cross-section. This process is theoretically and experimentally investigated by the authors. Aluminium alloy unequal angles of 75 x 50 x 12 mm were bent about the short flange, whilst the long flange was bevelled. The forcing load is first found theoretically on the assumption that plastic deformation arises at a relatively small flexure of an element. A power relation is assumed between stress and strain in the process of elasto-plastic bending. The total forcing load is the sum of the load to carry out the bending of the Card 1/3 profile, the load to twist the flange to be bevelled, the

load to bend the bevelled flange in its root section and the load due to friction. The separate contributions are evaluated, making use, in part, of some well-known formulae of Nadai. The design of the die facilitates the separation of the load components which largely arise in different sections of the die. The experimental work was carried out on an "Amsler" tensile testing machine where the diagram of the forcing loads was recorded. The comparison with analysis shows that, on the assumption of a friction coefficient of 0.15, the total measured load at 7,500 kg was 12.5% larger than the total predicted load. The largest error of the theory arose in the zone of beveling in the die. The process of bending of a profile, for example an angle, by the thinning or upsetting of the flange edge can also be accomplished by forcing through a die with suitable inserts. Such an insert is shown in Fig 5 and

a brief analysis is given to determine the forcing load
in this type of die from the basic geometry of the
profile deformation.

There are 6 figures, 1 table and 6 Soviet references.
