TITLE: Stratigraphy of Pre-Gothlandian Paleozoic in Podolia
(K stratigrafiyi dogotlanskogo paleozoya Podolii)

PERIODICAL: Uch. zap. Khar'kovsk. un-ta, 1955, Vol 61, pp 67-79

ABSTRACT: The article examines the stratigraphy of pre-Silurian deposits in Podolia. From the bottom upward they are: Kamensk, Mogilev, and Ushitskaya series, the lowest of which is composed of the extrusive-tuffaceous rocks and the upper two of the sedimentary sandstones, aleurolites, clays and limestones. These three series are divided into ten horizons. The whole section spans the period from the Cambrian to the Middle Ordovician inclusive. These series are overlain by the formations of the Molodovo horizon which belong to the Upper Ordovician. Total thickness of the formation varies from 300 m to 350 m.

AUTHOR: Yevseyev, V. A. SOV/20-122-4-57/57

TITLE: On the Physiological Analysis of the Development Mechanisms of Tetanus Intoxication (K fiziologicheskому analizu mekhanizmov razvitiya stolbnyachnoy intoksikatsii)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 4, pp 741-744 (USSR)

ABSTRACT: Although the nervous mechanisms determining the course of the intoxication mentioned in the title could be explained to a great extent (Refs 2-6, 10), the role of the higher nervous system, especially that of the cerebral cortex is still insufficiently investigated. After having given a review of the publications (Refs 2, 4-9, 11, 12), the author mentions the purpose of his paper: to investigate the problem by means of adequate physiological methods, especially to carry out an experimental analysis of the effect of the tetanus intoxication on the higher nervous activity and to ascertain the sensitivity of the animals of different types of higher activity towards tetanus. For this purpose 35 white rats were used, for which previously a system of positive and negative dependent reflexes has been worked out, (motor-alimentary method by

On the Physiological Analysis of the Development SOV/20-122-4-57/57
Mechanisms of Tetanus Intoxication

L. I. Kotlyarevskiy). By this measure the types of the higher nervous activity were ascertained. All animals were inoculated with 1/3 DLM of the tetanus toxin (varying according to the weight of the animals) and it was inoculated into the lefthind-paw. The amount was 0,5 ml. The experiments showed that in the animals of the highly equilibrated type (sil'nyy uravnoveshenny tip) the picture of the cortical processes (korkovyye protsessy Pl.) was completely analogous to the one recorded before the experiment. With most rats of other types no stabilization of the dependent reflex activity at all could be observed for two months (predominantly animals of the weak /slabyy/ type). Or a high weakening of the effect of the process of irritation (razdrazhitel'nyy protsess) could be ascertained. This was most distinctly noticeable with the rats of the irritable (vozbudimyy) type, which in their behaviour towards the samples are not different from the representatives of the weak type. The rats belonging to the intermediary variation of the equilibrated type (either with a certain predominance of the processes of irritation or with its relative weakness) showed a similar behaviour. The clinical picture showed clear regularities with

Card 2/4

Mechanisms of Tetanus Intoxication

respect to different illness or the death of some types of the rats. The mobility of the affected extremity was soonest restored with rats of the highly equilibrated type (44 days after the injection of the toxin). The loss in weight was highest in the weak type. First a peculiarity and a certain specific way of the reaction of the cells of the cerebral cortex on the effect of the tetanus toxin is striking, among them are mainly a temporary restoration of the dependent reflexes in the animals during the development of the local manifestation of the intoxication and an unusually quick normalization of the higher nervous activity in rats of the highly equilibrated type. The author expresses assumptions on the causes of this phenomenon. The results obtained show the importance of the role played by the fundamental processes of the nerves in the cerebral cortex and of the interrelations in the development of the tetanus intoxication and in the tetanus resistance. It is obvious that the best conditions for the protection against tetanus are provided by the cerebral cortex, namely by the active living state of its cells. A long-lasting and thoroughgoing inhibited activity of the

perature range, up to that of the decomposition of BiFeO_3 . The temperature dependence of the dielectric constant and of the loss angle were measured at 9.4×10^9 cps and the relative elongation was measured in the temperature range 20 -- 380°C. The samples were prepared by the usual ceramic technology. The dielectric measurements were by a standard short circuited-waveguide method. The temperature dependence of the thermal expansion was measured with a dilatometer. The plot of the curve with many steps, each corresponding to a different phase transition and agreeing with earlier results. The strongest anomaly was observed at the highest temperature, at 840 -- 850°C, which is shown to be the Curie temperature. Almost all the dielectric constant anomalies are duplicated on the elongation curve. Although the interpretation of the data is still impossible, it is suggested that the dielectric anomalies are related to the ferroelectricity and that the elongation anomalies are necessary to determine the physical properties of the material. The authors would like to thank Dr. G. S. Nolas for his interest and G. E. Andreyev

ABSTRACT: The temperature dependence of the thermal emf of tin and germanium tellurides were studied in order to investigate their physicochemical nature and changes in bond character associated with the fusion of these compounds. To this end, a special apparatus was constructed which permitted measurements of differential thermal emf over a wide temperature range in a vacuum or in an inert gas atmosphere in both the liquid and solid state. A correlation was noted between the character of the temperature dependence of the thermal emf and the electrical conductivity of

germanium and tin tellurides in the liquid and solid state. The presence of hole conductivity and the decrease in thermal emf with rising temperature of the melt confirm the conclusion, reached on the basis of electrical conductivity measurements, that these tellurides remain semiconductors after they have melted, and indicate that these substances are not semimetals in the solid state. TITLE: Study of the thermal emf's of group V chalcogenides in the solid and liquid state

SOURCE: AN SSSR. Investiya. Neorganicheskiye materialy, v. 2, no. 6, 1966, 976-979

TOPIC TAGS: thermal emf, bismuth compound, antimony compound, telluride, selenide

ABSTRACT: The differential thermal emf's of the compounds Bi_2Te_3 , Bi_2Se_3 , Sb_2Te_3 and Sb_2Se_3 were studied over a wide temperature range (up to 1000°C) in the solid and liquid state. A substantial drop in thermal emf on melting was observed; this is attributed to an increase in the carrier concentration and an equalization of the electron and hole mobilities. The magnitude of this drop is decreased by the "anionic" replacement by a lighter element, due to the tendency of the thermal emf to increase in the liquid phase as Te is replaced by Se. It is shown that the sign of the thermal emf of Sb_2Se_3 and Bi_2Se_3 changes after superheating in the liquid state. A correlation was observed between the nature of the temperature dependence of the thermal emf and the electrical conductivity in the solid phase at high temperatures in Sb_2Te_3 ; this is thought to be due to a decrease in deviations from stoichiometry in the Sb_2Te_3 phase as the temperature rises. On the whole, data on the thermal emf of the

TOPIC TAGS: electronic circuit, computer, reliability

ABSTRACT: A method is set forth for calculating the reliability of electronic circuits which takes into account gradual failures by analyzing the functional relations which describe the circuit operation. The problem statement is based on the assumption that the electronic-component parameters are realizations of some nonstationary random processes and that the static conditions of circuit operation are known. The random functions are dealt with in their canonic form. The system of inequalities that determines reliability parameters is solved by the Monte Carlo method on a digital computer in accordance with an algorithm described in detail. A Supplement presents a program for estimating the reliability of a trigger circuit which controls the potential input of a coincidence circuit. Four figures. Bibliography of 4 titles.

TOPIC TAGS: system reliability, electronic circuit

ABSTRACT: A method is offered for estimating parameters of electronic circuits, from the reliability viewpoint, with an allowance for gradual failures. The operability conditions expressed as relations between the electrical parameters of components are known. An optimality criterion is introduced which characterizes the margin of reliability $\gamma_c(t_1)$ at the time moment t_1 on the basis of the reliability margin of the characteristic $\bar{\gamma}_j(t_1) - \gamma_j(t_1)$. The minimum reliability margin is

$\gamma_c = \min_i \{\gamma_j(t_1)\}, i=1, 2, \dots, m$; $\bar{\gamma}_j(t_1)$ is a function of random quantities that characterize the component parameter spread. An algorithm of an iteration parameter search which ensures the system reliability optimization is examined. The algorithm is intended for a high-speed digital computer. One figure. Bibliography of 3 titles.

TITLE: Iteration method of constructing systems with stationary random parameters

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 6, 1965, 41-48

TOPIC TAGS: automatic control, automatic control system, automatic control theory

ABSTRACT: The selection of optimal parameters of a specified-structure system on the basis of its required output characteristics is considered. The normal system operation is described by a vector formula $\varphi(x) \leq 0$, where x is the vector of system parameters. The problem of finding the optimal parameters is reduced to the problem of finding the minimum of the function $\varphi(x)$. The function $\varphi(x)$ is assumed to be convex and differentiable. The iteration method of finding the minimum of the function $\varphi(x)$ is based on the gradient method. The iteration process is stopped when the gradient of the function $\varphi(x)$ is zero. The iteration process is stopped when the gradient of the function $\varphi(x)$ is zero. The iteration process is stopped when the gradient of the function $\varphi(x)$ is zero.

ABSTRACT: A metrica is presented for calculating the optimal parameters of electronic systems from the point of view of reliability with account of optimal failures. The metrica is based on the method of linear programming and is used for finding the optimal solution of the problem of reliability optimization of the system. The method of linear programming is used for solving the problem of reliability optimization of the system. The method of linear programming is used for solving the problem of reliability optimization of the system. The method of linear programming is used for solving the problem of reliability optimization of the system. The method of linear programming is used for solving the problem of reliability optimization of the system.

On Some Deficiencies of the Book Dealing With Magnetic Materials
(O nekotorykh nedostatkakh knigi o magnitnykh materialakh)

PERIODICAL:

Elektrичество, 1958, Nr 12, pp 81-82 (USSR)

ABSTRACT:

The book by A. S. Zaymovskiy and L. A. Chudnovskaya, "Magnetic Materials" (Gosenergoizdat, Publisher) was published in 1957. Also magnetic high-frequency materials are dealt with in this book. Having worked for many years in the field of such materials, the author of the present paper makes a number of remarks and points out to several deficiencies of this book with respect to these materials. He also mentions the lack of accuracy to be found in the description of the development of the ferrites in the USSR. The ferrite technology has been developed by a large group of researchers among them are S. N. Matveyev, M. A. Shevel'ko, L. I. Epshteyn, A. A. Kosarev, Yu. V. Basikhin and others.

Vaynshtejn, Ed.

Preface: This book is intended for physicists, physical chemists, electronic engineers, and technical personnel engaged in the production and use of ferromagnetic materials. It may also be used by students in advanced courses in radio electronics, physics, and physical chemistry.

Contents: The book contains reports presented at the Third All-Union Conference on Ferrites held in Minsk, Belarusian SSR. The reports deal with magnetic transformations, electrical and galvanomagnetic properties of ferrites, studies of the growth of ferrite single crystals, problems of the chemical and physico-chemical analysis of ferrites, studies of ferrite having a rectangular hysteresis loop and multicomponent ferrite systems exhibiting spontaneous hysteresis, problems in magnetic attraction, highly coercive ferrites, magnetic spectroscopy, curvemagnetic resonance, magneto-optical, physical properties of ferrites, applications in electrical circuits, anisotropy of electrical and magnetic properties, etc. The Committee on Research, AS USSR [S. V. Tonovsky, Chairman] organized the conference. References accompany individual articles.

AUTHOR YEVSEYEV V.M. (Moscow)
 TITLE The Analog Computer Without Stabilized Supply.
 PERIODICAL (Reshayushchiy usilitel' bez stabilizirovannykh istochnikov
 pitaniya.- Russian)
 Received: 6/1957
 Avtomatika i Telenekhanika 1957, Vol 18, Nr 5, pp 427-436
 Reviewed: 7/1957
 ABSTRACT The paper under review investigates a computing amplifier with parallel amplifying channels. Each of these channels amplifies the input signal in a certain frequency range and has, at change in the scheme parameters and in the voltage of the supply sources, no shifting and no drift at the outlet of the supply to the two amplifying channels which are connected in addition such an amplifier also has a summing amplifier Y_2 and the retroactive elements T_1 , T_2 and T_3 , Z_1 and Z_2 . In order to determine the time constants T_1 , T_2 and T_3 , three equations are set up. The mathematical interrelationship for the determination of T_3 is given, and for the determination of T_1 and T_2 there serves the circumstance that the phase shift of the circuit of parallel channels is equal to zero, as well as the permissible deflection in the amplitude-frequency characteristic at the

CARD 1/2

Frequency (ω). The paper under review gives the basic properties and particularities of the amplifier and its principal wiring diagram, as well as the results of the experimental examination of the amplifier. The performance which is used by the amplifier depends mainly on the input cascade because all other cascades operate with small currents. The examination led to the conclusion that the scheme as described in the present paper satisfies the given requirements and also that, if compared to other known schemes, the present scheme, if the technological characteristics are the same, is more reliable and, because no lamps are necessary in the supply source, much more economical. TITLE:

Fast-neutron Scintillation Layer Detector for Measurements
Against a Gamma Background

PERIODICAL:

Acta Physica Polonica, 1960, Vol. 19, No. 6, pp. 675-682

TEXT: The authors describe a scintillation layer detector with high efficiency for fast neutrons and low efficiency for gamma rays. The layer detector is based upon the difference between the range of protons and electrons of the same energy. The detector is designed for neutron measurements in the energy range between 5 and 20 Mev and consists of 28 layers made of plastic scintillators (on the basis of polystyrene), and is arranged in two sections, one behind the other. In each section, the light from the even layers is directed into two FEU-29 photomultipliers, the light from the odd layers is led into two other FEU-29 photomultipliers.

Card 1/2

for Measurements Against a Gamma Back- B011/B059
ground

If the electron energy is sufficiently high so that the electron can pass into the adjacent layer, then both photomultiplier sets (odd and even) will produce pulses simultaneously. The electronic circuit cancels those coincidences and allows only single pulses (produced in any of the photomultipliers) to reach the pulse-height analyzer. In order to characterize the decrease in counting efficiency for neutrons and gamma rays when the coincidence circuit (resolution 0.4μ sec, veto pulse 0.6μ sec) is turned on, the discrimination coefficient (ratio of pulses with coincidence circuit off to pulses with coincidence circuit on, both at the same level of the integral discriminator) is introduced. For neutrons, this coefficient did not exceed 1.5, for gamma quanta, however, it had much higher values. The authors thank N. W. Sizov for help in the work with the Cockcroft-Walton-type accelerator, as well as D. K. Akimov and V. A. Zapevalo for their assistance in the construction of the electronic part. There are 6 figures and 6 references: 2 Soviet and 3 US.

TITLE: A Multilayer Scintillation Detector for the
Recording of Neutrons in the Presence of γ -rays

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No. 1,
pp. 68 - 72

TEXT: A description is given of a neutron detector having
a high sensitivity to neutrons but a low sensitivity to
 γ -rays. The detector is designed for the energy range
5-20 MeV. The detector is similar to that reported by Baker
and Rubbia (Ref. 4). The multilayer detector is based on the
difference between the ranges of protons and electrons of the
same energy. The detector consists of a number of thin
scintillators, each having a thickness h . The scintillators
are separated by opaque partitions. The device is so arranged
that scintillations from layers 1, 3, 5, etc. are recorded
by one photomultiplier and scintillations from the remaining
layers by another. If the energy of an electron is sufficient

Card 1/4

20685

S/120/61/000/001/020/062
E032/E314**A Multilayer ...**

for it to penetrate into a neighbouring layer, then coincident pulses will be produced in the two photomultipliers. The electronic circuitry employed is such that it rejects coincident pulses. Non-coincident pulses arising in either of the photomultipliers are analysed by a kicksorter. In this way, one can separate recoil protons from electrons due to γ -rays. The multilayer detector consists of 28 discs (diameter 80 mm, $h = 4$ mm). The discs are made from a plastic based on polystyrene with the addition of 2% p-terphenyl + 0.2% α NPO. The neighbouring discs are separated from each other by pieces of black paper, 0.05 mm thick. The detector consists of two identical parts placed in series. In each part, scintillations from "even" discs are collected through perspex light pipes by the corresponding to multipliers, whilst the scintillations from the "odd" discs are collected by two other photomultipliers. In order to prevent the light from the "even" discs from entering the photomultipliers belonging to the "odd" discs (and conversely), the side surfaces of the discs are separated into four equal parts and two (opposite) of these are covered

by an aluminium foil. Altogether, the detector incorporates 8 photomultipliers of the type $\Phi\gamma-1$ (FEU-29). Each photomultiplier was placed in a separate magnetic screen made of soft iron. The light guides were not in optical contact with the scintillators, which reduced the amplitude of the pulses but simplified the operation. Pulses from each photomultiplier group were amplified and equalised in amplitude. The maximum amplitude of Co^{60} γ -ray pulses was about 0.01 V. The pulses were then fed into an adding circuit and the pulses from the adding circuit and those from one of the photomultiplier groups were fed into a coincidence circuit and a discriminator, which were so arranged that coincident pulses were rejected while those which were not in coincidence were allowed to pass on into a kicksorter. Detailed tests carried out on this detector have shown that its sensitivity to γ -rays is lower by a factor of 2 and its sensitivity to neutrons is higher by a factor of 2, as compared with the detector reported by Baker and Rubbia in Ref. 4. It is said that this is due to the fact that the thickness of each scintillator in the present instrument is

lower by a factor of 1.2 while the total thickness of the device is smaller by a factor of 2.7, as compared with Ref. 4. There are 6 figures and 6 references: 2 Soviet and 4 non-Soviet.

AUTHOR: Yovnovich, M. L. (Yovnovich, M. L.); Evseev, V. S. (Evseyev, V. S.)

TITLE: On interaction constants in μ^- capture

SOURCE: Nukleonika, v. 9, no. 2-3, 1964, 101-105

TOPIC TAGS: asymmetry coefficient, angular distribution, neutron, mu-meson capture

ABSTRACT: An attempt is made to obtain improved values for the asymmetry coefficient α in the angular distribution of neutrons of the direct process due to polarized μ^- capture by nuclei and improved interaction constants used in calculating μ^- capture rates. In this case, a recent measurement [1] of α at a very high threshold of neutron registration in μ^- capture in Ca^{40} is discussed; the maximum value of α is close to -1 with $\pm 15\%$ accuracy. At the high energy threshold of approximately 20 Mev. (maximum asymmetry), α then ≈ 0.34 .

Card 1/4

ACCESSION NR: AP4043035

The previously given set of four constants used for measuring λ at low thresholds cannot produce agreement between the theoretical and experimental values of the μ^- capture rates

$$\Lambda_H, \Lambda_{He^3} + H_3, \Lambda_z, \Lambda_{C12} + B12\lambda.$$

This requires consideration of one more constant, the scalar g_S whose appearance may mean the existence of local anomalous scalar muon-nucleon interaction. Here $g_S(\ell) = m_\ell F_S(q^2)$, where m_ℓ is the muon mass in the case of μ^- capture and the electron mass m_e for β decay, $F_S(q^2)$ is the induced-scalar form factor, and $q_S(\ell)$ is present in the most general expression for the vector matrix element. The following formula is given for determining λ :

$$\left. \begin{aligned} g_V^{(u)} &= 0.97 g_V^{(n)}, & g_A^{(n)} &= g_A^{(u)}, \\ g_P^{(u)} &= 8 g_A^{(n)}, & g_M^{(u)} &= 3.7 g_V^{(n)}, \end{aligned} \right\} \quad (1)$$

where $g_V^{(u)}$, $g_A^{(u)}$, $g_P^{(u)}$, and $g_M^{(u)}$ are the vector, pseudovector,

Card 2/4

ACCESSION NR: AP4043035

induced pseudoscalar, and weak magnetic constants, respectively;
 $\gamma = v/2m_p$, where v is the neutrino momentum and m_p is the proton mass.
The set of constants

$$G_F \approx g_V^{(n)} + g_S^{(n)} \quad (2)$$

permits reaching agreement between all fundamental experimental data in μ^- capture, except the radiative μ^- capture rate. No weak electric constant $g_A^{(n)}$ appears in (2); it apparently can be combined with $g_A^{(u)}$. "In conclusion, the authors wish to express their thanks to V. B. Berestetsky, L. D. Blokhintsev, S. S. Gerashchenko, E. I. Dolinski, I. Yu. Kobzarev, L. I. Lapidus, L. V. Okun', I. Ya. Pomeranchuk, and I. S. Shapiro for valuable advice and discussions."

ABSTRACT : Open fractures of the tibia were created in rabbits five days after being under high-altitude conditions (3600 m. above sea level) and at depths of 810 m. 5 to 30 days later, the rabbits were sacrificed and histologic studies were made of the bony callus. The mobility of the fracture, which disappeared under depth conditions on the 20th to 25th day, was delayed until the 30th day at high altitudes; the phase of inflammation was more prolonged at the high altitudes; osteoblastic granulation tissue was converted to osteoid later, the osseous seams of the callus were thicker, shorter, and fewer in number than at depth conditions; the

TITLE: VKDUS power silicon diffusion-type thyristors

SOURCE: Elektrichestvo, no. 5, 1966, 58-61

TOPIC TAGS: Thyristor, power thyristor, semiconductor device/VKDUS thyristor

ABSTRACT: Some test results and nominal characteristics of Soviet-made VKDUS silicon diffusion-type power thyristors, developed in 1964, are reported. The thyristor (see figure) has a 5-layer n-p-n-p-n structure with cutermost junctions shunted by metal contacts. The junctions are prepared by successive diffusion of B, Al, P in a single-crystal silicon plate 1.5 mm thick. The plate having a resistivity of 10 ohm cm. Physical processes transpiring in the 5-layer structure are explained. Nominal peak voltages of VKDUS thyristors are 30--600 v. Nominal currents are 25--150 amp, depending on the type of cooling

TITLE: Branching of the input current into the collector region in a junction transistor

SOURCE: Radiotekhnika i elektronika, v. 11, no. 5, 1966, 958-960

TOPIC TAGS: junction transistor, collector emitter junction

ABSTRACT: In some circuits the part of the input current that flows into the collector region may be rather large. Current distribution in a 3-layer structure with open collector circuit is shown. This structure is represented as a p-n-p-n structure, and this formula is set up for the branched-into-collector current:

$I_i = I_{i\alpha} + I_{i\alpha n} + I_{i\alpha p}$. Here, α_n and α_p are the current gains in a common-base circuit of the theoretical $p_2-n_2-p_1$ and $n_1-p_1-n_2$ transistors, respectively; $I_{i\alpha 0}$ is the reverse current of a part of the collector junction. The input-current derivation into the collector region can be used in some transistors, such as 4-layer and 5-layer structures. I-V characteristics of an experimental device are shown. Orig. art. has: 3 figures and 4 formulas.
