"Solution of Phosphoric Acid As Ideally Concentrated Solutions", Zhur. Fiz. Khim. 15, No. 9, 1939. Moscow, Colloids-Electrochemical Institute.
Received 3 March 1939.

9. ~~USSR~~ Report U-1415, 3 Jan 1952

Behavior of phosphoric acid solutions as ideally concen-
 trated solutions. I. D. Fick. *Compt. rend. acad. sci.*
U. S. S. S. 23, 804-7 (1930) (in English).—The differen-
 tial heat of diln., $\Delta H/\Delta N$, was measured for 20 to 80% aq.
 solns. of H_3PO_4 . Vapor pressures were calcd. from the
 equation $P_i = P_0 + as + bs^2 + cs^3 + ds^4$, where s is the
 percentage concn., P_0 the vapor pressure of water and
 a, b, c and d are consts. The max. work was obtained
 from the equation $A = RT \ln(P_0/P_i)$. When $A/18 =$
 $f(N)$ and $Q/18 = f'(N)$ were plotted, the two curves were
 rather near each other, they differed most in the dil. solns.
 and nearly merged in the more concn. solns.

<p>Protective films on iron from the vapor of silico-organic compounds. I. D. Yudin. <i>Compt. rend. acad. sci. U. R. S. S.</i> 25, 614-17(1939)(in English).—Fe strips after special cleaning, polishing and drying were suspended, resp., in test tubes each of which contained approx. 1 cc. of an orthosilicate (prepd. from SiCl_4 and an excess of anhyd. MeOH, EtOH or PrOH), heated to $230-300^\circ$ and held at this temp. for 15-20 min. The Fe strips were then heated at 80° for 5-6 hrs. and further heated in paraffin oil (with access to air) at $230-240^\circ$ for 3-5 hrs. The films formed on the Fe were colored and lustrous; that formed in the presence of Et orthosilicate protected the Fe (1) against 3% NaCl soln. for 5-7 days (unprotected Fe corroded in 5-7 hrs.), (2) against corrosion under varying vapor pressure for 5 months (unprotected Fe corroded in 15-20 days) or (3) against I vapor. The results obtained by the use of Me and Pr orthosilicates were variable.</p> <p style="text-align: right;">George Ayers</p>

<p><i>The Method of Thermal Deposition of Chromium on Articles with the Use of Chlorine Gas.</i> N. S. Garbanov and I. D. Yudin (<i>Compt. rend. (Akad. Sci. U.R.S.S., 1946, 51, (4), 285-287).</i> [In French]. Methods of coating articles with metallic chromium by heating in chromium chloride vapour are reviewed. In general, atm. of hydrochloric acid gas or hydrogen are employed. A method is proposed in which the coating is carried out in an atm. of chlorine. The articles to be coated, together with crushed chromium or ferro-chrome, are enclosed in iron capsules, and the whole is heated at 900-1100° C. with a dry chlorine atm. inside the capsule. No special treatment of the articles, such as degreasing, is necessary; the heating is continued for 4-20 hr., according to the thickness of deposit required. Details are given of the thicknesses attained after 2, 4, or 8 hr. at 900°, 1000°, and 1100° C., and the results are compared with those obtained using other atm., and in a vacuum. Corrosion experiments show that chromium coatings produced by the recommended method give good protection against 3% NaCl and 35% HNO₃.—G. V. R.</p>

Hardness of chrome diffusion coatings. N. S. Gorbunov, I. D. Yudin, and N. A. Izgaryshev. *J. Applied Chem.* (U.S.S.R.) 20, 384-8(1947) (in Russian). Coatings were produced by thermal diffusion of Cr powder at 1000°, 6 hrs., in a Cr atm., on iron and steel samples of C 0.05 to 1.07, on cast iron (C 3.5, at 0.02°) and on Chromansil (C 0.35, Si 1.20, Sn 1.10, Cr 1.10). On samples of the iron-steel group, of approx. the same initial microhardness 150-100 (under 50 g. load), Cr coatings showed hardnesses increasing with the C content of the base material, from 257 to 1450. To cast iron (initially 137), the coating imparted a hardness of 1920, to Chromansil (118), 1205. Hardness of thermal Cr coatings is enhanced by C and alloying-element content of the base metal. N. T.

MECHANICAL PROPERTIES OF CHROMIUM DIFFUSION COATINGS.
N. S. Gorbunov, I. D. Yudin, and N. A. Izgaryshev
(Institute of Physical Chemistry, Academy of Sciences of
the U.S.S.R.). *Compt. rend. acad. sci. U.R.S.S.* 55,
415-17 (1947) (in English); cf. C.A. 40, 7006⁹.—Diffusion
coatings of Cr formed on Fe do not differ considerably in
microhardness from the base metal. Those formed on steel
show an increase in microhardness with its C content.
Those formed on cast Fe are so hard as to be able to cut
glass. This behavior is attributed to the formation of Cr
carbides in the diffusion layer. J. M. Blocher, Jr.

TITLE:

On the equivalence of different structure diagrams
of closed anti-stalling regulators

SOURCE:

Avtomaticheskoye regulirovaniye avaidvigatelye;
sbornik statey. no. 3. Moscow, 1961, 102 - 112

TEXT:

The author investigates the regulators using temperature as a controlling factor. Equivalence of structures of regulators with respect to input parameters is established. A table is given quoting transfer functions of initial structures and those of structures equivalent to each one of the former. Effect of some structures on the stability of the system is discussed. Conditions of equivalence of some external factors (angle of rotation of the throttle and the compressor blades) are found. There are 2 tables.

AUTHOR: Yudin, I. K.

TITLE: The thermal treatment of a bimetallic copper-steel wire produced by the metallurgical method

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 130, abstract 51790 ("Tr. Konferentsii po metizn. proiz-vu, 1959". Chelyabinsk, 1961, 143 - 149)

TEXT: Presented are the results of investigations carried out with a copper-steel wire with cores from 15 F (15G), 45 and Y7 A (U7A) steels. At the plant, the recrystallization annealing of bimetallic billets (at temperatures which are by 100 - 200°C higher than the temperature of the recrystallization of Fe) is carried out in three-zone ШО-130 (ShO-130) shaft furnaces under muffle. It is noted that for securing a uniform heating of the metal during the annealing and for obtaining homogeneous mechanical properties, the temperature in the lower zone of the furnace must be by 40 - 60°C higher than in the upper zone. The patenting of bimetallic billets with cores from medium-carbon and high-carbon steels is used for obtaining a wire with improved strength. The billets were

Card 1/2

The thermal treatment of a...

S/137/62/000/005/124/150
A160/A101.

heated at a temperature of 870 - 880°C. This temperature was maintained until the billets were placed in a salt bath. In view of the fact that fine martensite-type impurities were observed during the patenting of the bimetallic wire at a salt-bath temperature of 490°C (for a period of 20 minutes), the patenting was carried out at relatively low rates and at somewhat increased bath temperature. It is shown that the harmful effect of Fe in the Cu layer on the electric conductivity of the bimetallic wire may be eliminated by tempering and aging the wire. The press drawing of the wire (aged after the drawing), even with small overall reductions, sharply increases σ_p and decreases δ . The aging of the bimetallic wire, which is subjected to intermediate annealing may be conducted at the expense of the isothermal holding when cooling down from the annealing temperatures. Thus, by using cores from medium and high-carbon steels and patenting before the drawing to the finished size, it is possible to obtain a bimetallic wire which 1.5 - 2 times exceeds the strength of the wire now turned out.

TITLE: Control systems for airfield electric power units

ABSTRACT: The operation and control of diesel engines

(or even to increase) the speed of the diesel engine and simultaneously limit the rise of electric power by lowering the generator voltage. The effectiveness of this method was illustrated by an oscillogram showing the variations of current, voltage and speed. The author concludes that the method is effective.

PHASE I BOOK EXPLOITATION

SOV/4259

Yudin, Lev Grigor'yevich, and Viktor Fedorovich Preys

Plastmassy i ikh ispol'zovaniye v mashinostroyenii (Plastics and Their Utilization in Mechanical Engineering) [Tula] Tul'skoye knizhnoye izd-vo, 1959. 108 p. 3,000 copies printed.

Ed.: M. N. Tylkin; Tech. Ed.: L. I. Pulin.

PURPOSE: This book is intended for students and technicians working in the field of plastics.

COVERAGE: The authors discuss the development, nature, types, and industrial uses of polymers. Several types of compression molds and techniques used in manufacturing plastic articles are described. The book reflects the experience of industrial enterprises under the Tula Council of National Economy in the production of plastic articles and outlines the expected development of the plastics industry for 1959-65. Chapters I-IV and VI were written by L. G. Yudin in consultation with V. F. Preys. Chapter V was written by V. F. Preys.

~~Card 1/3~~

Plastics and Their Utilization (Cont.)

SOV/4259

The material for Chapter VI was provided by the Machine-Building Office of the Tula Council of National Economy and is based on a report made by V. P. Polyakov. There are 26 Soviet references.

TABLE OF CONTENTS:

Introduction	3
Ch. I. Properties of Plastic Materials and Their Use in Industry	
1. Raw materials. Nature of polymers	6
2. Methods of obtaining polymers	9
3. Composition of plastic materials	10
4. Classification of plastic materials	11
5. Thermoplastic materials from polymerization products	12
6. Thermosetting molded materials from polymerization products	20
7. Synthetic fibers	26
Ch. II. Methods of Fabricating Parts From Plastic Materials	
1. Selection of raw materials	32
2. Compression molding of thermosetting plastic materials	35
