TITLE: Quantum-chemical studies of sulfur compounds [This paper was presented at the Symposium for Organic Sulfur Substances held in Liblice from 15 to 17 June 1964.]

SOURCE: Chemické listy, no. 1, 1966, 7-21

TOPIC TAGS: organic sulfur compound, sulfate, conjugate bond system, physical chemistry property, sulfur compound, electron spectrum, chemical reaction kinetics, aromatization, quantum chemistry, heterocyclic base compound

ABSTRACT: The relationship between the theoretical and experimentally found properties of organic sulfates is discussed. The classical types of conjugated/sulfur compounds are described. Difficulties in predicting properties of organic sulfur compounds are evaluated. The following classes of compounds are discussed in detail: thiocarbonyl compounds, disulfides, sulfur analogues of aromatic conjugated hydrocarbons, sulfoxides, sulfones, and some inorganic substances. The electron spectra, chemical reactivity, physical properties, and formation of aromatic rings are

SOURCE: Chemicks listy, no. 3, 1966, 289-311

TOPIC TAGS: quantum chemistry, organic chemistry

ABSTRACT: Importance of quantum chemistry for interpretation of known facts, and for predicting properties of substances that were not yet studied, and those that have not yet been synthesized are discussed. Electronic structures of organic substances, and Huckel's approximation method of molecular orbits for the study of organic compounds are described. Properties of various compounds determined by the method of molecular orbits are tabulated. Principles for the determination of the aromatic character of organic compounds are discussed. Use of heats of formation in prediction of reactivity of compounds is described. Estimation of stability of organic compounds is discussed. Orig. art. has: 13 figures, 2 formulas and 5 tables.

TITLE: High-precision control of rate of electric drive

37
B

SOURCE: Avtomatyka, no. 2, 1965, 69-75

TOPIC TAGS: automatic control design, negative feedback, automatic control system

ABSTRACT: The article surveys the error inherent in automatic control systems. The characteristics of a discrete rate control system are summarized. Systems of high-precision automatic control of the rate of electric drive are discussed. The advantages of continuous and discrete automatic control systems are compared. The operator equipment of a discrete control system with respect to its accuracy and stability is analyzed. The advantages of a discrete rate control system with feedback of the rate and its derivative are compared with the advantages of both. The continuous part includes a discrete tachometer, quartz generator, frequency...

cy divider, reversible counter, a unit for transforming a discrete quantity into a continuous one, and a general setting block for the continuous and discrete parts. The equations describing the processes in this system are set up and the conditions for the stability of the coordinate is obtained. The numerical values of the transition probabilities and the experimental results confirmed the correctness of the theoretical calculations. The relations of the rate during the transition process and the transition probabilities are maintained.

Budapest, Kiserletes Orvostudomány, Vol XVIII, No 4 Aug 66, pages 410-417.

Abstract: [Authors' Hungarian summary] The central nervous systemic effects of benzene and xylene were studied. The method involved observation of changes in the frequency of spike bursts evoked by the placement of strychnine on the exposed cerebral cortex. The data obtained suggest the possibility that, when administered acutely into the organism (in 0.7 ml/kg amounts), benzene and xylene also attack some point in the brain stem in addition to their cortical paralyzing effect. 6 Eastern European, 12 Western references. TITLE: Lacquer protective coating

SOURCE: Tekhnika i vooruzheniye, no. 5, 1966, 56-57

TOPIC TAGS: ^{protective coating,} paint, lacquer, varnish / 23-0513 lacquer

ABSTRACT: The use of less expensive water-soluble lacquer paints is briefly discussed. For experimental testing a 23-0513 lacquer was used for laying a 30-micron first coat by means of two pneumatic sprayers of 4 and 115 atm. The results were satisfactory in both cases. It is mentioned that this lacquer paint requires a longer time for evaporating volatile components before hot drying. A period of 30 min is needed for evaporation of about 70% of volatile substances. A convection method of heating is usually applied. The heating by infrared rays is less effective for water-soluble lacquer paints. The advantages of the eventual use of electrophoresis processes for water-soluble lacquer paints is stressed.

TEXT: In order to improve the performance of centrifugal pumps of the 5H-5X 2 (5N-5Kh 2) and 5H-5X 4 (5N-5Kh 4) type, the Nal'chik mashino-stroitel'nyy zavod (Nal'chik Machinery Plant) replaced the sliding-contact bearings by rolling-contact (antifriction) bearings. This made it possible to increase the mechanical efficiency, to reduce the distance between the pump-shaft supports, and hence the shaft length and pump size. This resulted in increased service life of the packings and higher delivery of the pumps.

TITLE: Determination of antimony microconcentrations in high-purity tin by the method of amalgam polarography with accumulation

SOURCE: Ref. zh. Khimiya, Abs. 20G152

REF SOURCE: Izv. Tomskogo politekhn. in-ta, v. 128, 1964, 50-52

TOPIC TAGS: antimony, tin, ~~bismuth~~, electrolysis, polarography, amalgam, trace analysis, HIGH PURITY METAL

ABSTRACT: A method is described for determining Sb traces in high-purity tin, based on preliminary separation of Sn in the form of $SnBr_4$ and subsequent determination of Sb by the method of amalgam polarography with accumulation against the background of 5N H_2SO_4 + 50% ethanol. The anode peak of the Sb was observed at -0.1 v. Bi, Cu, and Sn do not interfere with determining the Sb. A 4-ml concentration of HBr + 1 ml Br_2 is used in dissolving 0.5g of Sb. The solution is evaporated to dryness in a chamber at 170C, then 1 ml 6N HCl is added to the residue, and Sb (5+) is reduced to Sb (3+) with sodium hypophosphite (30-40 mg) at 60-70C. The solution is evaporated 2-3 times after adding water.

Card 1/2

L 33425-66

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 21, 1962, 140, abstract 21Zh92 (Roczn. chem., v. 36, no. 2, 1962, 367 - 368 [Pol.; summary in French])

TEXT: A new unsaturated $C_{10}H_{18}O$ alcohol of unknown structure has been produced by the action of B_2H_6 on 1,3-dimethyl-1-ethyl-cyclohexa-3,5-diene (I) followed by oxidation. Over a period of 4 hours, 2.35 g of B_2H_6 are passed through 0.5 moles I dissolved in 200 ml of ether, in H_2 atmosphere (at $0^\circ C$). The ether is distilled off in vacuo, 30 ml water, and then a mixture of 70 ml 30% H_2O_2 and 60 ml of 3 N NaOH are added; $C_{10}H_{18}O$ is extracted from the reaction mixture with ether; its boiling point is

Let K be a ~~family~~ one-parameter family of plane curves, given by $y = F(x, t)$, where the parameter t stands for the ordinate at $x = 0$. If $y_1 = F(x, t_1)$, $y_2 = F(x, t_2)$ satisfy $y_1 - y_2 = t_1 - t_2$ for all x , then y_1 and y_2 are said to be parallel. The set $\{K\}$ is divided into equivalence classes of parallel curves. The following are some characteristic results: $F(x, t)$ is continuous with respect to t and, for fixed x , F is almost everywhere differentiable with respect to t ; the set of equivalence classes of parallel curves is not denumerable, unless it reduces to a single class. It seems to me, however, that the conclusions stated are incomplete and he was not able to follow the author's argument.

TITLE: An Automatic Polarimeter (Avtomaticheskiy polyarimetr)
PERIODICAL: Pribory i Tekhnika Eksperimenta, 1957, No.4,
pp. 78 - 81 (USSR).

ABSTRACT: The operation of the polarimeter (type CA-1) is based on the relationship between the rotation ($\Delta\psi = \alpha lc$) of the plane of polarisation of light and the concentration c of the investigated optically-active material for given values of the thickness l of the solution layer and the specific rotation α of the material.

Fig.1 shows the block diagram of the polarimeter. Light from a 100 W electric lamp passes through a double-lens condenser to a polariser. The intensity of the plane polarised light is caused to vary sinusoidally (50 c.p.s.) by a magnetic-optical modulator and passes through a light filter, a polarimetric tube with the investigated substance, a quartz compensator, and analyser, and then to a photo-cell which converts the light intensity variations into an alternating current. The compensator consists of two quartz prisms: one fixed (left-hand rotation), and the other movable (right-hand rotation). To correct for refraction, a glass prism is inserted between the two quartz prisms.

Card 1/2

An Automatic Polarimeter.

120-4-22/35

The polariser and the analyser are made from polaroid film so that in the absence of an optically-active solution in the polarimetric tube, no light reaches the photo-cell. When the solution is introduced between the polariser and the analyser, light falls onto the photo-cell and its intensity depends on the angle of rotation of the plane of polarisation due to the solution. This rotation is compensated by automatic rotation of the movable quartz prism, which is servo-controlled by the phase and frequency of the photo-cell output current. The reading is obtained from projection of the scale which is directly attached to the movable prism. Fig. 3 shows the light intensity and photo-cell current oscillations for different rotation angles. Fig. 4 is a photograph of the apparatus. Constructional and operating details are given. The instrument measures from -40 to $+100$ S ± 0.1 S. There are 3 figures and 2 Slavic references.

TITLE: Objective-Glass Polarimeter with Automatic Adjustment (Субъективный поляриметр с автоматической настройкой)

PERIODICAL: "Izmeritel'naya Tekhnika", No 5, Sep-Oct 1957, pp 69-72 (USSR)

ABSTRACT: The subject photoelectric objective-glass polarimeter with automatic setting, for use in the sugar industry, was designed by Kiyev Plant of Control Gages (Kiyevskiy zavod kontrol'no-izmeritel'nykh priborov) on suggestion of Engineer V.I. Kudryavtsev. The first unit of this instrument, called "sakarimetr CA" was shown at the 1956 All-Union Industrial Exhibition. A second improved model, demonstrated at the 1957 All-Union Industrial Exhibition, is now being produced by the same Kiyev plant. The design and operation of the instrument is described in full detail. It represents a photoelectronic optical device, the optical portion of which consists of a polarimeter and a projection system, and the electrical portion consists of an indicator, a follow-up system, an amplifier, feed blocks, and a reversible electric motor. The scale is graduated in degrees of the international sugar scale. The readings show directly the weight per cent of saccharose in the investigated medium. The measurement

Card 1/2

Objective-Glass Polarimeter with Automatic Adjustment

115-5-30/44

error is claimed to be less than with the existing conventional visual instruments. Its high sensitivity (0.05° S, or 0.017 circular degree) and accuracy make the instrument applicable also for checkups of other saccharimeters, of quartz tablets, or of cover glasses of polarimeter tubes for absence of inner stresses.

The article contains 1 photograph and 2 diagrams.

TITLE: A Mercury Illuminator in Refractometry (Rtutryy osvetitel' v refraktometrii)

PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 6, p 83 (USSR)

ABSTRACT: A quantitative analysis of solutions is mostly made by the refractometric method, in which the refraction index of the solution depends on the quantity of dry matter dissolved in it. The refraction index depends also on the wave length of the monochromatic light used. Usually, the spectral line of sodium is employed. For higher precision a shorter wave length such as that of mercury is used. A mercury lamp has been developed which is contained in a glass bulb and is equipped with a light filter for the mercury line. The lamp is of the type PRK-4. The device indicates dry substances in solutions with an accuracy of 0.1 %. There is 1 table.
