AUTHOR: Zubtsov, Ye. I.

TITLE: Structural-Facial Zones of Tyan'-Shan' and the Deep
Fractures (Reported at the Annual Session of Scientific
Council VSEGEI on April 5, 1955). [Strukturno-fatsial'
nyye zony Tyan'-Shanya i glubinnyye razlomy (Doklad na
godichnoy sessii uchenogo soveta VSEGEI 5 aprelya
1955 g.)]

PERIODICAL: Inform. sb. Vses. n-1, geol. in-ta, 1956, Nr 4, pp 38-45

ABSTRACT: It has been assumed until now that Paleozoic deposits of
the Chatkal-Naryn Zone appear to be chiefly a facial
variety of Middle Paleozoic formations (Silurian, Devonian
and Lower Carboniferous), developed in the "inner"
Fergana-Kokshal zone of the southern Tyan'-Shan' geo-
syncline. Only in the northwest, in the Karatau and
Dzhebagly Mountains, was there a known section of a dif-
ferent structure with a large discontinuity and an angu-
lar unconformity in place of the Silurian and the lower

lower half of the Devonian. This section was not considered typical for the whole Chatkal-Naryn zone, but only for its northern margin. The author and other geologists explained that such a structure of the Paleozoic section exists also in the remaining territory of the Chatkal-Naryn zone, which fact sharply contrasts the latter with the Fergana-Kokshal zone and also with the southern Tyan'-Shan'. The author considers the Chatkal-Naryn zone [together with Kuraminskaya zona (zone)] as an individual structural-facial zone separated from the south and north Tyan'-Shan' zone by the large and deep marginal faults (see the diagram). Overthrusts lying near these sharp borders are considered as local and without any influence on bringing together of the facies. The author emphasizes the great value of a study of the deep marginal fractures for clarifying the development of active crustal zones, for solving the problems of metallogenesis and for guiding the exploratory activities.

AUTHORS: Chirkova-Zalesskaya, Ye. F., Zubtsov, Ye. I.
TITLE: New Finds of Stéphanian Stage Flora in Central Tien Shan
(Novyye nakhodki stefanskoy flory v Srednem Tyan'-Shane)
PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 4,
pp. 776 - 778 (USSR)

ABSTRACT: M. D. Zalesskiy (Reference 1) described in 1928 fossil flora from the region in question which is very similar to the complex of the Stéphanian flora of western Europe. On the strength of this single found the late Paleozoic and floristic distribution of zones of the whole earth was reconstructed (Reference 2). In this connection further finds, 200 km west of the first site (Naryn-Tau), i.e. in the Kok-Irim-Tau-chain (1955) are interesting. The found was made by Ye. I. Zubtsov and Ye. I. Zubtsova and was investigated by Ye. F. Zalesskaya. The containing rock is described. Then the author repeats the details of the first found of the flora in question (Reference 1), and describes the composition of the flora from Kok-Irim-Tau.

Card 1/2

New Finds of Stéphanian Stage Flora in Central Tien Shan

A strange lycopod (Lycopodiaceae): Maroesia rhomboidea Goth. and Jong. (Reference 3) is striking here. This type was described from north west Sumatra. Then the single sites of Stéphanian flora are enumerated. The finds were made in Kok-Irim-Tau in three different places, however, in approximately the same horizon. A description of the last mentioned plant (figure 1) follows. Then the position of the layers is compared with the flora in question in Kok-Irim-Tau and in Sumatra. There are 2 figures and 3 references, 2 of which are Soviet.

TITLE: New Discoveries of Marine Permian Deposits in the Tien-Shan
(Novyye nakhodki morskikh permskikh otlozheniy v Tyan'-Shane)

PERIODICAL: Doklady AN SSSR, 1957, Vol. 116, Nr 4, pp. 681-683 (USSR)

ABSTRACT: It is customary to consider the northern margin of the Fergana and Tarim depression as the northern boundary of the marine Permian deposits in Central Asia. There is an assumption according to which the coast line of the Permian sea took its course somewhat northwards in the east of the line Bogbu-Tau mountains - south eastern slope of the Chatkal chain. Since this assumption was up to now not confirmed, the discovery of marine lower Permian deposits in the north west of the Fergana, i. e. in the district of the Naryn depression by the two first authors in 1956 is interesting. The finds are of two different places (their distance is 60 km): a) in the eastern part of the Baybiche-Tau chain (Ulan river valley) and b) on the southern slope of the Naryn-Tau chain. At the Ulan river the exposures have a breadth of 800m and 3 km. They are covered by unconform red-colored tertiary deposits in the north and border in the south along the fracture to a thick chalk mass of lower carboniferous. The real character of

Card 1/3

New Discoveries of Marine Permian Deposits in the Tien-Shan.

20-4-42/51

the Permian-carboniferous-relation is not quite clear here. The cross section is described in detail and the names of the fossils of single horizons are given. The total thickness of the lower Permian amounts here to 470 m. In the Naryn chain a thick complex of terrigenous deposits of the upper palaeozoicum is developed. Final conclusions. According to the quantity and the systematic composition of the foraminifera the Permian exposures of the Baybiche-Tau chain are much richer than those of the same age of Naryn-Tau. The differences are apparently connected with the facial peculiarities of the sites. The knowledge given in the paper concerning the systematic amount of the fusulinides in the Baybiche-Tau exposure shows that the two fauna zones (the lower with a paraschwagerina quantity; the upper with a lot of parafusulines) on the whole correspond to the central Karachatyf horizon of Fergana (according to the stratigraphic scheme by Miklukho-Maklay). Any original species which do not occur in the early Permian of the Fergana depression lack here. The occurrence of a rather great quantity of forms is striking; they are similar to those of the upper part of Tayyuan' series of North China and to those of the Chuan'-Shan' series of South China. Very interesting is the discovery of 3 species which are described from the Car-

Card 2/3

New Discoveries of Marine Permian Deposits in the Tien-Shan. 20-4-42/51

nic Alps (A. Shel'vin), here in great number of individuals. There are only few species which could be found in the schwagerine layers of the Russian Plateau and in the near-Ural region. From the occurrence of the same species in the Carnic Alps, Fergana, and China it can be concluded to especially favorable migration conditions of the fauna in the latitudinal extension. There are 3 Slavic references.

TEXT DATA

Coverage: This monograph belongs to the "Synoptic Meteorologist's Library" series. It is written in a popular form to summarize recent Soviet achievements in the study of cyclones and anticyclones. According to the author, modern Soviet methods have left far behind western progress in meteorology. The booklet deals with the fundamentals of the advection and dynamic theory of the development of cyclones and anticyclones. This theory was worked out by Kh. P. Pogosyan and N. L. Tabarovskiy, and is based on I. A. Kibel's hydrodynamic theory of local changes in atmospheric pressure. The author maintains that this is an original Soviet theory unknown to

1/3

Voznikoveniye i razvitiye tsiklonov i antitsiklonov

AID 507 - I

foreign scientists. Fundamentals of this theory are given in the following works:

Taborovskiy, N. L., Hydrodynamic Theory of the Baroclinic Atmosphere and Basic Problems of Synoptic Meteorology, 1947.

"Study of a Three-dimensional Model of a Front Embracing All the Troposphere and the Lower Stratosphere," by G. D. Zubyan, Meteorologiya i Gidrologiya, No 5, May 57, pp 3-11.

The article considers the problem of the analysis and prognosis of large temperature changes in the upper troposphere and the lower stratosphere, and fluctuations of the tropopause on the basis of a three-dimensional model of a front embracing all the troposphere and the lower stratosphere.

The movements of a frontal zone over a period of 8 days is studied. Diagrams showing cross sections of the frontal zone over different geographical regions indicate the natural connection between fluctuations of the tropopause and frontal zone. (U)

SOV/50-59-1-1/20

TITLE:

The Interlatudinar Exchange of Warm and Cold Air Masses in the Stratosphere in Winter (O mezhshirotnom obmene teplykh i kholodnykh mass vozdukha v stratosfere zimoy)

PERIODICAL:

Meteorologiya i gidrologiya, 1959, Nr 1, pp 3-12 (USSR)

ABSTRACT:

This is an evaluation of results of synoptical investigations made at the end of January - beginning of February 1958 on the station Severnyy Polyus-7 (SP-7) while it drifted at about 85° north latitude and 156-158° west longitude. For comparison, the measurements of Station Saratov (51° 34' north latitude, 46° 03' east longitude) are added. The temperature distribution characteristic of summer with gradients directed from the pole to the equator is disturbed during the polar night. In the stratosphere, a warm belt with relatively high temperatures forms which comprises the whole hemisphere. Large gradients directed towards the pole are built up north of this belt. They cause a strengthening of west winds at an increase in height, and a stratospheric jet stream on the margin of the polar night. - A disturbance of this winterly normal condition occurred in the period of time observed. The following was

Card 1/3

The Interlatudinar Exchange of Warm and Cold Air
Masses in the Stratosphere in Winter

SOV/50-59-1-1/20

found: 1. An extraordinary increase in temperature in the central arctic due to advection of warm air from temperature zones. 2. A great decrease in temperature in the temperate latitudes due to a spreading of cold air from the arctic basin towards the south. 3. An inversion of the vertical stratification of temperature over the central arctic and the temperate latitudes in contrast to the one characteristic of winter. 4. A considerable shift of the warm belt in the Pacific and North-American section to the north, and a shift of the arctic "cold cap" to the south towards Europe and West Siberia. 5. A concentration of large horizontal temperature gradients over the pole, and an approach of the stratospheric jet stream to the pole. 6. A splitting of the polar cyclone, the formation of a zone of increased pressure over the central arctic, and thus an essential change in circulating conditions. A general regularity for this process could not be ascertained. Also other variants appear well possible. A connection between atmospheric processes in the middle stratosphere and those in other layers can be explained for every concrete case only by means of a synoptic analysis of the temperature fields.

Card 2/3

TITLE: Surges of considerable stratospheric temperature fluctuations over Armenia

SOURCE: AN ArmSSR. Doklady, v. 42, no. 3, 1966, 159-165

TOPIC TAGS: troposphere, atmospheric temperature

ABSTRACT: The paper cited below gives some results of investigation of the stratosphere over Armenia on the basis of daily aerological observations at Yerevan in 1961. Aperiodic temperature changes in Armenia occur not only in the troposphere and lower stratosphere, but also in the higher layers of the latter, possibly to its upper boundary. These variations are observed for the most part in the warm season of the year and in the middle stratosphere frequently attain 10-15° in 1-2 days. The most important causative factor apparently is vertical air movements induced by the stratospheric subtropical frontal zone. The article gives an extremely well-expressed case of this stratospheric temperature change in the second half of August 1961. At the same time, the temperature fluctuations in the troposphere were up to 10-14° but the temperature changes in the stratosphere and troposphere were opposite in sign. This case was associated with penetration of a cold air mass, but not all such stratospheric temperature changes are caused by such events. The key factor is vertical air movements, which are discussed in general, and in application to the particular case considered. This article was presented by Academician AN ArmSSR S. S. Mertschyan on 18 October 1965. Orig. art. has: 3 figures, 1 formula and 1 table. [JPRS: 37,397]

¹⁴Transportation within a port (Vnutriportovyy transport) Moscow, Izd-vo "Transport", 1965. 165 p. illus. Errata slip inserted. 1500 copies printed.

TOPIC TAGS: marine engineering, railway engineering, highway engineering, railway transportation, ship, port

PURPOSE AND COVERAGE: This book is intended for students in mechanization, operations, and hydraulic-engineering specialities in higher educational institutions of the Ministry of the Merchant Marine; it may also be used by port and planning organization personnel in the merchant marine. Problems relating to the design, construction, and operation of rail lines in port areas, and short-distance access rail lines connecting ports to trunk lines and industrial complexes are reviewed. The planning and construction of port facilities, sorting facilities, sorting yards, motor transport access roads, and roads connecting various port areas are also discussed.

DIPHTHERIA

"An attempt to Use Fluorescent Microscopy for the Diagnosis of Diphtheria", by Yu. N. Zubzhitskiy, Laboratornoye Delo, No 2, March-April 1957, pp 35-38

The author adopted Keller's test (fluorochroming with coryphosphine, 1939) and, as a result of his experiments, asserts that the method by fluorescent microscopy of the diphtheric bacteria renders it possible to accelerate and to obtain more accurate laboratory diagnosis of diphtheria. This test is quite accessible for daily use in every bacteriological laboratory.
