Title : Effects of Hormones Upon the Productivity of  
Rabbits.

Orig Pub: Vestn. s.-kh. nauki, 1957, No. 2, 115-117

Abstract: Experiments were carried out on 4 groups of  
rabbits consisting of 8 male and 7 female  
rabbits in each group. The first group was  
the control group. The second group received  
pregnene with their food, the third group were  
given pregnene with their food and were subcu-  
taneously injected with progesterone, and the

4th group was subcutaneously injected with progesterone only. These hormones were given in 1 mg daily dosages per animal for a period of one month. In rabbits of the 2nd group, weight increases amounted to 14.8, of the 3rd group to 48.7, and of the 4th group to 19.3 percent. As progesterone was introduced to 15-day-old baby rabbits in a 0.5 mg daily dose per each rabbit, their weight increased by 23.8 percent as compared with controls during a period of 40 days.

TITLE: Investigation of the Kinetics of the Establishment of Magnetic Texture in 65-Per-Cent Permalloy (Issledovaniye kinetiki ustanovleniya magnitnoy tekstury v 65%-nom permalloye)

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1958, Vol 22, Nr 10, pp 1212 - 1216 (USSR)

ABSTRACT: In the present paper the author investigated the kinetics of the changes of magnetic properties in 65-permalloy due to low-temperature treatment. The obtained results together with the known facts permit to establish an analogy between the processes that by a thermomagnetic treatment lead to the formation of a rectangular hysteresis loop and such processes by which the deformation of the hysteresis loops is caused: a) Alloys which exhibit deformed hysteresis loops are particularly sensitive to thermomagnetic treatment; b) deformed hysteresis loops form in about the same temperature range in which the thermomagnetic treatment is effective. In the case of 65-permalloy the inferior limit is between 380 - 400°; the kinetics of the establishment of rectangular

Card 1/3

Investigation of the Kinetics of the Establishment  
of Magnetic Texture in 65-Per-Cent Permalloy

SOV/48-22-10-10/23

and deformed hysteresis loops follow an identical law. In the case of increasing temperature the rectangular and deformed hysteresis loops are produced in a high degree. The duration of the establishment of well-pronounced hysteresis loops is about the same and amounts to 2 - 3 hours at 440° and 15 - 20 minutes at 500°. From the results can be deduced that the deformation of the hysteresis loops as well as the formation of rectangular loops is caused by the formation of a magnetic texture. The type of the texture, however, must be different in both cases. As is known a rectangular hysteresis loop is caused by an orientation of the induction of the domains predominantly in the direction of the magnetic field applied during the thermomagnetic treatment. The formation of the deformed hysteresis loops apparently is connected with a complicated distribution of the magnetization of the domains. It is possible that the common reason for the formation of both types of hysteresis loops is an oriented-ordered distribution of the atoms in the lattice of the alloy (Refs 5 and 6). When optimum conditions for the thermomagnetic treat-

Prilozheniya spetsy (Precision Alloys) Moscow, Metallurgizdat, 1960. 253 p. (Series: Itz; Spetsial'nyy, 779. 2) Errata slip inserted. 2,500 copies printed.

Additional Sponsoring Agency: USSR. Gosudarstvennyy planovyye komissiya. M.I. D.I. Gabrielyan; Ed. of Publishing House: Ye.I. Levits; Tech. Ed.: Ye.J. Vaynshteyn.

PURPOSE: This book is intended for engineers and scientific personnel in the metallurgical, instrument-production, and electrical-equipment industries, as well as for industrial personnel engaged in the production of precision alloys. It may also be useful to students attending advanced technical schools.

CONTENTS: The articles in this collection present the results of investigations conducted in recent years by the Central Scientific Research Institute of Precision Metallurgy (Central Army mechanical-technical institute chemistry metallurgy). The articles deal with industrial techniques of producing soft magnetic alloys, properties and structure of the alloys at extremely low temperatures and in high-frequency magnetic fields, deformation behavior, superconductivity, the galvanomagnetic effect, volume changes, etc. Some articles are concerned with the investigation of deformed hard magnetic alloys. No personalities are mentioned. The articles are accompanied by references, each Soviet and non-Soviet.

TITLE: Anomalies in the Magnetic Properties of Fe-Al Alloys at High Temperatures

PERIODICAL: Fizika metallov i metallovedeniye, 1960, Vol 9, Nr 1, pp 41-47 (USSR)

ABSTRACT: The magnetic properties of technically important iron-aluminium alloys with 8-16% Al depend greatly on heat-treatment conditions. In the present investigation the magnetic properties of alloys with 8.5, 9.5, 10.6, 12.8 and 15.3 weight % Al were studied. Specimens (of 0.1 mm thick toroids in a porcelain container) were subjected to heat treatment in a vacuum furnace. Measurements were carried out at fixed temperatures during heating and cooling with the aid of windings on the container. Fig 1 shows hysteresis loops for the 10.6% Al alloy obtained at frequencies of 50 c/s at 20, 300, 400, 500, 600 and 650 °C during heating. The kinetics of the change of magnetic properties for the same alloy during isothermal treatment at 300 °C as a series of hysteresis curves for annealing in and without a magnetic field is

Anomalies in the Magnetic Properties of Fe-Al Alloys at High Temperatures

shown in Fig 2, and the influence of demagnetization on the form of the hysteresis curves in Fig 3. The hysteresis curves for the alloy with 12.8% Al for a series of temperatures up to 550 °C during heating and cooling in and without the magnetic field are given in Fig 4. The hysteresis curves for the 15.3% Al alloy during heating are shown in Fig 5 for the heating process at 20, 400, 420 and 450 °C. Fig 6 shows the magnetic properties at room temperature of alloys as functions of aluminium content. The work showed that with 8-13% Al the high-temperature magnetic properties are those characteristic for perminvar-type alloys. There is a regular relation between the perminvar and thermomagnetic treatment effects, which the author does not consider to be directly linked with ordering processes. The disappearance of both effects in the 12.8% Al alloy on cooling to room temperature (as shown in Fig 4) is attributed by the author to the formation of an almost completely ordered atomic distribution over the lattice points. Ya.S. Shur (Ref 7) has proposed that the

Anomalies in the Magnetic Properties of Fe-Al Alloys at High Temperatures

thermomagnetic-treatment effect is associated with changes in the structural state of the ferromagnetic. As developed by later authors (Refs 8, 9), these directed ordering ideas can explain the observed perminvar properties and their relation to the thermomagnetic-treatment effect. The author considers that the discrepancies between his and other (Refs 11, 12) results and those of Taniguchi (Ref 10) are due to simplifying assumptions made by the latter in his calculations (which indicated that perminvar properties can only arise with negative values of the anisotropy constant). The observed growth, at high temperatures, in coercive force of alloys with almost stoichiometric composition (Figs 4, 5) which had been reported previously (Refs 2, 13) is due to lattice stresses produced by order-disorder transformation; these stresses arise through the appearance and growth of disordered regions in the ordered matrix.

**TITLE:** On the lengthwise uniformity of the resistance of an extremely thin wire.

**SOURCE:** Moscow, Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metallurgii. Sbornik trudov. no. 25. Moscow, 1962. *Pretsizionnyye splavy*. pp. 104-116.

**TEXT:** This paper reports the results of an experimental investigation, performed at the TsNIIChM (Central Scientific Research Institute of Ferrous Metallurgy) intended to develop a methodology and construct equipment for the continuous inspection of the uniformity of the electrical resistance (ER) of extremely thin wires in the source of their motion. The problem is of the greatest importance for a variety of calculating and telemechanical devices in which the uniformity of the electrical resistance of potentiometer wire is a decisive element in determining the accuracy of measurements and telemetered information. The equipment newly constructed was used for the determination of the uniformity of the resistance of Ni-Cr wire 20-50  $\mu$  in diam. The experimental equipment comprises an idling feed spool and motor-driven take-up spool, between which the wire is guided by textolite guide rollers while in contact with a pair of spaced-apart contact rollers made of stainless steel

## On the lengthwise uniformity of the resistance ....

B/776/62/000/025/007/025

with a Cr-plated surface. Diam of the contact rollers is 50 mm, that of the guide rollers 20 mm. A braking load is applied to the feed spool. Measurements can be made at contact distances of 1 m or 0.5 m. The linear velocity of the wire is 23-25 m/min. The resistance measurements were performed by means of a DC bridge of the type MBJ (MVU) 49, a high-speed potentiometer of the type БП102 (BP102), and various auxiliary equipments. The theory of the dependence of the ER of the wire on the mechanical stresses prevailing therein is briefly outlined for given values of the Poisson coefficient and the Young modulus of elasticity. The results of an experimental illustrative test are shown graphically, illustrating the linear variation of the dependence up to the elastic limit for a 0.04-mm diam Ni-Cr wire. The conditions necessary to avoid any plastic bending stresses that may arise in contact with the guide and contact rollers are specified. Problems arising from the characteristics of the measuring equipment, the contact equipment, and the deformations of the wire while passing through the contact equipment, and the verification of the functioning of the entire equipment are discussed. It is found that the method and the equipment adopted here are suitable for the continuous measurement of the uniformity of the ER of micron wire along its length in the course of its motion. It is established that the degree of uniformity of the ER becomes less favorable with decreasing thickness of the wire. It is shown that cold-hardened wire exhibits a significantly better uniformity of the ER along its length as compared with

Card 2/3

On the lengthwise uniformity of the resistance ....

5/776/62/000/025/007/025

wire that has been subjected to heat treatment. The source of the impairment of the uniformity in the latter is attributed primarily to the quenching of the wire in the furnace system. It is shown that significant impairments in the uniformity of the ER of a wire along its length can be produced by careless unwinding and rewinding.

S/776/62/000/025/009/025

AUTHOR: Zusman, Sh. I.

TITLE: The effect of thermomagnetic treatment and the Perminvar effect in soft magnetic alloys.

SOURCE: Moscow. Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metallurgii. Sbornik trudov. no. 25. Moscow, 1962. Precisatsionnyye splavy. pp. 126-145.

TEXT: The paper describes the results of an experimental investigation of the kinetics of the changes in magnetic properties of alloys of the system Ni-Fe (65 and 75% Ni), Fe-Ni-Co (25% Co, 45% Ni), Fe-Co (43, 51, and 66% Co), and Fe-Al (8.3, 10.6, and 12.8% Al) at elevated temperatures ( $T$ ). The objective of the investigation was a study of the laws governing the processes that occur in alloys at elevated  $T$  and that are linked with the effect of thermomagnetic treatment and the Perminvar effect. The alloys selected for this investigation pertained to different crystallographic systems: the cubic face-centered (the Ni-Fe and Fe-Ni-Co alloys) and the cubic body-centered (the Fe-Co and Fe-Al alloys). Among the alloys investigated there are ordered alloys (in the sense of long-range order: the 15% Ni-Fe, the 51% Co-Fe, and the 12.8% Al-Fe) and unordered (the 8.3% Al-Fe) alloys. The various alloys had different values of physical constants that affect the level of the

Card 1/3

The effect of thermomagnetic treatment . . . .

\$/776/62/000/025/009/025

magnetic properties (the anisotropy constant  $K$ , the magnetostriction  $\lambda$ , the saturation magnetization  $I_s$ , etc.). The oscillographic and ballistic methodology employed in the investigation is that described by the author in the same sbornik, no. 23, 1960, 205. A Perminvar effect was made evident in the Fe-Al system, most pronouncedly at  $T$  above  $300^\circ$ . Thus the Perminvar anomaly is not a peculiarity of the Fe-Ni alloys (binary and ternary alloys with ferromagnetic components), but appears to be a characteristic of a broader class of ferromagnetic solid solutions. Thermomagnetic treatment of these alloys leads to breakdown of the Perminvar effect and an increase in the residual induction, however, the Fe-Al alloys differ from Ni-Fe, Fe-Ni-Co, and Fe-Co alloys by the fact that the hysteresis loop does not become rectangular. Alloys with Perminvar properties are found to be more sensitive to thermomagnetic treatment. The processes linked to these effects proceed in the same  $T$  region and become more intense at higher  $T$ . The processes linked to the effect of the thermomagnetic treatment and the Perminvar effect proceed considerably more intensely in alloys with a body-centered lattice (the Fe-Al and Fe-Co alloys) than in alloys with a face-centered lattice (Ni-Fe and Fe-Ni-Co alloys). This, apparently, can be attributed to the greater diffusional mobility of the atoms in the body-centered lattice as compared with that of the face-centered lattice. Ordering has a substantial effect both on the effect of the thermomagnetic treatment and on the Perminvar effect. The processes that are linked to the effect of the

Card 2/3

The effect of thermomagnetic treatment . . . .

SI/776/62/000/025/001/025

thermomagnetic treatment proceed more slowly in ordered alloys than in unordered alloys. In alloys of the Perminvar type having a stoichiometric composition (the alloys Ni<sub>3</sub>Fe, Fe<sub>3</sub>Al), a protracted ordering anneal inhibits the Perminvar properties, whereas in alloys having a composition far from the stoichiometric, such anneal leads to a maximal development of Perminvar properties. The regularities of the processes connected with the effect of the thermomagnetic treatment and the Perminvar effect established in the present work can be quantitatively explained on the basis of the assumptions of the theory of directed ordering. There are 4 figures, 2 tables, and 23 references (8 Russian-language Soviet, 3 German, and 12 English-language, of which 1 in Russian translation).

TITLE: The effect of thermomagnetic treatment in a cross-sectional field on the magnetic properties of alloys of the system Fe-Ni-Co

SOURCE: Fizika metallov i metallovedeniye, v. 20, no. 1, 1965, 153-155

TOPIC TAGS: iron containing alloy, nickel containing alloy, cobalt containing alloy, permalloy, thermomagnetic effect, Curie point

ABSTRACT: More than 25 permalloys of the Fe-Ni-Co ternary system were studied with compositions 20-60% Ni, 15-35% Fe, remainder Co. The specimens were toroids turned from alloy ribbon .02 mm thick. During thermomagnetic treatment in a cross-sectional field the magnetic field is applied in the direction of the toroid axis. To reduce demagnetizing effects several toroids are joined axially and extended at the ends by Permendur cores - an alloy with high saturation and high Curie point. The

Card 1/4 UDC: 538.245 : 213

L 6974-66

ACC NR: AP5018870

treatment takes place in a furnace mounted in a solenoid. For all alloys investigated thermomagnetic treatment in a cross-sectional field leads to significant changes in magnetic properties.  $\mu_{\max}/\mu_0$  which characterizes the constancy of susceptibility at varying H falls from 4-8 to 1.1-1.3; while  $\mu_0$  rises by 1.5-2 times.  $\mu_{\max}$  decreases by 2-3 times, significantly lowering the residual induction. After the treatment specimens show magnetic stability and insensitivity to "magnetic shock," characteristics opposite to the instability shown by permivar alloys cooled slowly without a magnetic field. Also B(H) is most nearly linear for alloys located in a narrow region (of the ternary system) along a line with co-ordinates 36% Ni, 28% Co, 36% Fe; 43% Ni, 25% Co, 32% Fe; 47% Ni, 23% Co, 30% Fe; 53% Ni, 20% Co, 27% Fe. This line corresponds to the line of neutral, magnetic crystallographic anisotropy K [Puzey I. M., F M M, 1963, 16, 2, 179]. The magnitude of  $\mu_{\max}/\mu_0$  and the coefficient of the amplitude of instability of susceptibility  $\phi_H = \mu_1 - \mu_0/\mu_0 (H_1 - H_0)$  monotonously decrease inversely with holding time in the magnetic field during the thermomagnetic treatment. This is linked with the establishment and perfecting of a single axis of anisotropy. The level of susceptibility increases with temperature and decreases with holding time. The most linear magnetization curve is attained with long holding times at sufficiently low temperatures. Sample results are shown in Fig. 1. The alloy may be used as a constant susceptibility ferromagnet for the

TITLE: Device for controlling the accumulated circular pitch error in gears. Glass  
42, No. 178502

SOURCE: Izobreteniya, promyshlennyye obratzys, tovarnyye znaki, no. 3, 1966, 66

TOPIC TAGS: gear cutting machine, ~~actuating~~ transmission gear

ABSTRACT: This Author Certificate presents a device for controlling the accumulated circular pitch error in gears, based on the sequential measurement of error by the position of two identical profiles diametrically placed. The device contains a supporting and a measuring carriage, vertically adjustable centers for mounting the wheels in a fixture, synchronously rotating supporting and measuring probes in the form of worms in constant contact with the controlled gear, and a measuring device. To increase measuring accuracy and to simplify construction, the supporting and measuring probes are in the form of flat, split spring disks with part of the profile bent to the size of the controlled gear pitch. These are used to index the gear to the next measuring position (see Fig. 1).

**AUTHORS:** Al'tgauzen, O.N., Zusman, Sh. I., and Stepanova, A.N.

**TITLE:** Thermomagnetic treatment in vacuum furnaces of magnetically soft alloys with a rectangular hysteresis loop (Termomagnitnaya obrabotka magnitnomyagkikh splavov s pryamougol'noy petley gisterezisa v vakuumnykh pechakh)

**PERIODICAL:** Metallovedeniye i Obrabotka Metallov, 1958, Nr 11, pp 60-62 (USSR)

**ABSTRACT:** In the Institute for Precision Alloys TsNIIChm, a vacuum shaft furnace with spiral heating elements of nichrome and the alloy EI695 was used which made continuous temperature control of the furnace possible, particularly below 700°C. A sketch, Fig.1, shows the arrangement of the magnetising device and of the specimens during thermo-magnetic treatment (design proposed by N. A. Kalmychek, NII MRTP). The high temperature annealing and the thermo-magnetic treatment were effected in accordance with regimes enumerated in a Table, p 62. The magnetic properties of alloys after the thermo-magnetic treatment with fields of various magnitudes are graphed in Fig.2. The high temperature treatment consisted of annealing in vacuum at 1100°C for two hours, cooling with a speed

Card 1/4

SOV/129-58-11-11/13

Thermomagnetic treatment in vacuum furnaces of magnetically soft alloys with a rectangular hysteresis loop

of 100°C/hr to 600 and 200°C respectively, followed by cooling with the container in air. The thermomagnetic treatment consisted of the following: Alloy 50NP: heating at 600°C for one hour, cooling inside a magnetic field at 50°C/hr to 400°C, cooling by 100°C/hr to 200°C followed by cooling with the container in air; alloy 65NP: heating at 700°C for 4 hours, cooling inside a magnetic field to 200°C with a speed of 100°C/hr, followed by cooling in air with the container; heating to 800°C for one hour, cooling inside a magnetic field with a speed of 100°C/hr down to 200°C, followed by cooling in air with the container (alloy 34NMP). Analysis of the obtained results enables the following conclusions: for all the alloys separate high temperature and thermomagnetic treatment in vacuum can result in obtaining magnetic properties which satisfy the specified technical requirements. The magnitude of the magnetic properties depends to a large extent on the intensity of the field applied during the heat treatment; to obtain a maximum improvement of the magnetic properties it is sufficient for all

Thermomagnetic Treatment in Vacuum Furnaces of Magnetically  
Soft Alloys with a Rectangular Hysteresis Loop

the tested alloys to use a magnetic field potential of 10 to 15 Oe. An increase in the magnetic field strength does not result in an improvement of the properties of the alloys. Within the investigated thicknesses the effect of the thermomagnetic treatment is practically independent of the character of the applied field (d.c., pulsating or 50 c.p.s. fields), provided their amplitude values are the same. This conclusion confirms the results obtained by Kelsall (Physics, 1934, Nr 5). For larger thicknesses it is necessary to verify the influence of the surface effect in the case of treatment with an a.c. field. The carried out work has shown that the thermomagnetic treatment of the investigated alloys can be effected in furnaces used for high temperature treatment of these alloys, provided the magnetising circuits are fed with d.c. or a.c. currents.

AUTHORS: Aptekar', I.L., and Zusman, Sh.I.

TITLE: Magnetic and electrical properties and diagram of state of Fe-Al alloys close in composition to Fe<sub>3</sub>Al

PERIODICAL: Fizika metallov i metallovedeniye, v.12, no.3, 1961, 350-359

TEXT: This article describes a study into the kinetics of changes in magnetic and electrical properties of Fe-Al alloys at high temperatures. The object of the work was to establish relationships between these properties and the structural state of the alloys. The article opens with a review of previous work on the subject. The tests were made with an alloy containing 12.8 wt.% aluminium (23.2 at.%) which, according to Taylor and Jones (Ref.6; A. Taylor, R. Jones. J. Phys. Chem. Solids, 1958, Vol.6, 16, 37; J. Appl. Phys., 1958, Vol.29, 3, 522) is in the two-phase region at room temperature. For comparison, tests were also made with an alloy of 14.2 wt.% aluminium (25.4 at.%) which is close to the stoichiometric composition of the intermetallic compound, and an alloy with 8.3 wt.% aluminium (15.7 at.%).  
Card 1/8/

Magnetic and electrical properties and... S/126/61/012/003/003/021  
E194/E180

The alloys were melted in a high frequency induction furnace with a magnesite crucible. The amount of carbon, silicon and phosphorus was minimal in the melts and the total content of Mn and Si did not exceed 0.3%. The ingots were forged into bars, cleaned and hot rolled at 1000-1050 °C, and then cold rolled to a thickness of 0.1 mm. Strip samples for magnetic tests were vacuum annealed at 1100 °C for five hours with slow cooling to room temperature. The high temperature tests were made in vacuum. The magnetic measurements were made by ballistic and oscillographic methods; the coercive force was measured either on toroids with an internal diameter of 20 mm and an external diameter of 30 mm or on solenoids made of strips 120 mm long and 5 mm wide. Electrical resistance of hardened specimens was measured during rapid heating (500 °C/hour) and remeasured after a long annealing in vacuum. The kinetics of change in magnetic and electrical properties were studied on specimens quenched in water from 900 °C. Fig.1 shows the saturation magnetisation  $4\pi I_s$  and coercive force  $H_c$  as a function of temperature for the alloy with 12.8% weight aluminium. Fig.2 shows similar curves for alloys with 14.2 and 8.3% Al.

Card 2/8

Magnetic and electrical properties... S/126/61/012/003/003/021  
E194/E180

Fig.3 shows the change of coercive force of previously hardened specimens of the 12.8% aluminium alloy against holding time (in hours). It will be seen from Fig.1 that at about 400-600 °C there is a sharp maximum in the coercive force with a corresponding inflection in the curve of saturation magnetisation. There are no such anomalies in the curves for alloys of 14.2 and 8.3% aluminium. There are two clearly marked temperature regions in Fig.3; below 450 °C there is a comparatively small increase in the coercive force, but the increase becomes more marked at higher temperatures. Similar results were obtained on the 14.2% Al alloy but, since the Curie point of this alloy is 500°C, measurements of coercive force could be made only up to 450°C. By using the low inertia oscillograph procedure it was possible to follow changes in magnetic properties during rapid heating and cooling. Hysteresis loops were obtained for the alloy with 12.8% Al during heating over a period of 10-15 minutes to a temperature above the Curie point, and whereas at room temperature the hysteresis loops of water quenched samples are the same as those of slowly cooled samples, at high temperatures there is a considerable difference.

Card 3/8

Magnetic and electrical properties ... S/126/61/012/003/003/021  
E194/E180

With hardened samples there is no noticeable broadening of the hysteresis loop at any temperature, but with slowly cooled samples it was very pronounced between 450-575 °C. Resistivity is plotted against temperature in Fig.6; white circles refer to equilibrium conditions, black circles to the hardened state. It was found that the curves obtained on heating slowly cooled alloys are close to the equilibrium. Fig.7 shows the change of electrical resistance for hardened 12.8% aluminium alloy against holding time in hours. The resistance falls the faster, the higher the temperature. Comparing Figs. 7 and 3 it will be seen that, on isothermal holding, resistance changes more rapidly than coercive force. The following conclusions are drawn from the above results. In the alloy with 12.8% aluminium, two diffusion processes (with different values of activation energy and relaxation time) can occur in two distinct temperature ranges: 250-450 and 500-575°C. The alloy with 14.2% Al displays only one process similar to the low temperature process in the 12.8% Al alloy. Unusual physical properties, such as a maximum in the coercive force/temperature curve, an inflection in the saturation  
Card 4/8

Magnetic and electrical properties and.. S/126/61/012/003/003/021  
E194/E180

magnetisation curve, and a reduction in resistance as compared with the hardened condition, are observed in the 12.8% Al alloy above 450 °C in the equilibrium condition but not in the alloy with 14.2% Al. Comparison of these results with the equilibrium diagram of Taylor and Jones indicates that the change in the physical properties of alloys with 12.8 and 14.2% Al in the lower temperature region are due to the formation of a homogeneous order of type  $\alpha_{Fe_3Al}$  whilst changes in the properties of the alloy with 12.8% Al in the upper temperature region (up to 550°) are due to the formation of two phases, which is not in accordance with Taylor and Jones who suppose that there is a homogeneous phase in this region.

TITLE: Electrical-Control Systems for Automatic Machine Lines and Fundamental Problems in Their Further Perfecting and Development  
(Sistemy elektricheskogo upravleniya avtomaticheskimi stanochnymi liniyami i osnovnyye zadachi dal'neyshego ikh uluchsheniya i razvitiya)

PERIODICAL: V sb.: Avtomatizatsiya tekhnol. protsessov v mashinostr. Privedi i upravleniye mashinami. M., AS USSR, 1956; pp 84-98

ABSTRACT: Some peculiarities of automatic production-machine lines have been revealed as a result of an analysis of the electric-control systems of 14 lines. Underlying all the schemes of automatic machine-line control is the principle of control as a function of travel performed by working parts of the machine. An example is examined of automating a section of the line on which pistons are machined. The control of automatic lines has the following peculiarities: a closed control cycle for each individual machine, interconnections between these controls and with the control of transportation and loading devices and

Card 1/2

SOV/112-57-6-12391

Electrical-Control Systems for Automatic Machine Lines and Fundamental . . . .

with the control system of the entire line. Special devices are provided for fault location in automatic lines; a light signal of the automatic line is cited as an example. As coordination is necessary between electrical, mechanical, hydraulic, and pneumatic links, it is suggested that along with the simplified electrical circuit diagram, a block diagram of machines be compiled to facilitate understanding the operation of complicated combines. As an example, a block diagram of the control of a centerless grinding machine is presented. The principal equipment used in automatic lines are relays, contactors, and various track switches. The number of contact operations in this equipment may reach several tens of thousands per hour, and at an automatic piston factory, up to 300,000 per hour. As a result, the reliability of the line operation is largely dependent on the reliability of equipment operation and on its service life. Tasks for further improvement and development of electrical-control systems for automatic lines are outlined; the use of contactless control apparatus, multicircuit multicommand and pulse-distributing devices, electronic and semiconductor devices combined with magnetic automatic devices.

Kharizomenov, Igor' Vladimirovich, Doctor of Technical Sciences,  
Professor

Elektricheskoye obrudovaniye metallorezhushchikh stankov (Electrical  
Equipment of Metal-cutting Machine Tools) 2d ed., rev. and enl.  
Moscow, Mashgiz, 1958. 328 p. 25,000 copies printed.

Reviewer: Zusman, V. G., Candidate of Technical Sciences;  
Ed.: Khalizev, G. P., Candidate of Technical Sciences; Ed. of  
Publishing House: Shemshurina, Ye. A.; Tech. Ed.: Model', B. I.;  
Managing Ed. for literature on metal working and tool making  
(Mashgiz): Beyzel'man, R. D., Engineer.

PURPOSE: The book is approved as a textbook for machine-building  
vuzes by the Ministerstvo vysshego obrazovaniya SSSR  
(Ministry of Higher Education, USSR), and contains the

Card 1/8

462

Electrical Equipment of Metal-cutting Machine Tools

basic information necessary to engineers designing or operating modern metal-cutting machine tools.

COVERAGE: The book examines problems connected with the electrical equipment of metal-cutting machine tools. Systems and electromechanical properties of machine tool electric drives, fundamentals of dynamics, the equipment for machine tool electrification, and methods and systems of machine tool electrical automation are described. Special attention is paid to electrical control and automation and also to further possibilities of applying machine tool electrification in student designing. Recent achievements in machine tool electrification in the USSR and in other countries are reviewed. The book follows the program approved by the Ministry of Higher Education of the USSR. A knowledge of the principles of electrical engineering is a prerequisite. To help the mechanical

Card 2/8

Electrical Equipment of Metal-cutting Machine Tools 462

engineer in designing the machine tool, the book devotes considerable attention to the use of catalogue data for electric motors. No personalities are mentioned. There are 27 references, all of them Soviet.

TABLE OF CONTENTS:

Foreword	
Introduction	3
Ch. I. Equation of Motion	5
1. Basic concepts	9
2. Transition processes	9
Card 3/8	10

Electrical Equipment of Metal-cutting Machine Tools	462
Ch. II. Electromechanical Properties of Induction Motors	16
3. Mechanical characteristics	16
4. Starting up	23
5. Controlling speed of rotation	29
6. Operating conditions for braking	37
7. Structural shapes of induction motors	41
8. H-f electric motors	45
Ch. III. Electromechanical Properties of D-C Motors With Parallel Excitation	49
9. Mechanical characteristics	49
10. Starting up	53
11. Speed control	55
12. Operating conditions for braking	61
13. Structural shapes	64

Card 4/8

Electrical Equipment of Metal-cutting Machine Tools	462
Ch. IV. Drives With Variable Voltage	65
14. Motor-generator system	65
15. Dynamoelectric amplifiers and their use	71
16. Drives having magnetic amplifiers and adjustable transformers	79
17. Ionic drives	82
18. The selsyn and its application in machine tool construction	87
Ch. V. Determining the Power of Electric Motors	92
19. Heating of electric motors under load	92
20. Determining the power of an electric motor under a constant continuous load	97

Card 5/8

Electrical Equipment of Metal-cutting Machine Tools	462
21. Determining the power of an electric motor under a transitory load	97
22. Determining the power of an electric motor under a variable continuous load	102
23. Determining the power of an electric motor under a periodic transitory load	108
24. Energy characteristics of machine tool electric drives	112
Ch. VI. Equipment and Designs for Electrical Control of Metal-cutting Machine Tools	120
25. Equipment and design of hand-operated control	120
26. Equipment and design of contactor-type relay control	124
27. Basic designs of contactor control	140
28. Equipment and design of electric motor safety devices	145
29. Electromagnets and magnetic clutches	152
30. Electromagnetic chucks	165

Card 6/8

Electrical Equipment of Metal-cutting Machine Tools	462
Ch. VII. Electrical Automation of Machine Tools	174
31. Automatic control in relation to track	174
32. Automatic control in relation to time	189
33. Automatic control in relation to speed	198
34. Automatic control in relation to load	202
35. Electro-hydraulic automation of machine tools	207
36. Electrical duplicating in metal-cutting machine tools	213
37. Programmed control of machine tools	229
Ch. VIII. Electrification of Machine Tools and Automatic Lines	244
38. Rational degree and form of machine tool electrification	244
39. Designing and mounting machine tool electrical equipment	250
40. Electrification of turning lathes	268

Nauchno-tehnicheskoye obshchestvo priborostroitel'noy promyshlennosti

Avtomatizatsiya i mekhanizatsiya protsessov proizvodstva v priborostroyeni  
(Automation and Mechanization of Production Processes in Instrument  
Manufacturing) Moscow, Mashgiz, 1958. 591 p. 8,500 copies printed.

Ed.: Gavrilov, A. N., Doctor of Technical Sciences, Professor; Reviewer:  
Vladziyevskiy, A. P., Doctor of Technical Sciences; Ed. of Publishing House:  
Kochetova, G. F., Engineer; Tech. Ed.: Model', B. I.

PURPOSE: This book is intended for engineers, technicians, and scientific per-  
sonnel concerned with mechanization and automation of production processes in  
instrument manufacturing, and for students and teachers of this subject in  
vtuzes.

COVERAGE: The book describes the characteristic features of the present state  
of mechanization and automation of production processes in the instrument  
industry. Part 1. describes the planning of automation means, the theory of  
precision, economic efficiency under automated production conditions, and also

Card 1/15

Automation and Mechanization of (Cont.)

761

the theory and practice of overall mechanization and automation. Parts 2, 3, and 4 discuss the most characteristic and effective methods and means of automation and mechanization in all stages of instrument manufacturing. No personalities are mentioned. There are no references.

TABLE OF CONTENTS:

PART 1. GENERAL AND THEORETICAL PROBLEMS OF AUTOMATION AND MECHANIZATION OF PRODUCTION PROCESSES IN INSTRUMENT MANUFACTURING

Ch. I. Basic Trends in Automation and Mechanization of Production Processes in Instrument Manufacturing (Gavrilov, A. N., Doctor of Technical Sciences, Professor)	7
Ch. II, Problems in the Theory of Automatic Lines (Vladziyevskiy, A. P., Doctor of Technical Sciences)	20
1. Basic concepts	20
2. Size of banks between work stations along an automatic line	23
3. Determining of coefficients to compensate losses between two dissimilar work stations	24

Card 2/15

## Automation and Mechanization of (Cont.)

761

4. Relationships between features of a two-sector line which provide the line with a maximum output 33
  5. Determination of total specific losses along a line divided into an arbitrary number of sectors, using the method of two unequally working sectors 36
- Ch. III. Calculating the Precision of Technological Processes of Machining Under Conditions of Automated Production  
(Gavrilov, A. N., Doctor of Technical Sciences, Professor and Kurapov, A. N., Candidate of Technical Sciences, Docent) 41
1. Analysis of production errors arising from technological processes 41
  2. Compounding (synthesis) of production errors 51
  3. Example of calculating a compounded error 69
  4. Prospects for using the compounded error method 73
- Ch. IV. Theoretical and Experimental Features of Automatic Feeders  
(Vul'fson, I. A., Engineer and Dymshits, Ye. S., Engineer) 76

Card 3/15

Automation and Mechanization of (Cont.)	761	
1. Determining the probability of the efficiency features of automatic feeders		76
2. Evaluating the probability of entrainment of loaded parts		100
3. Experimental data for optimum values (based on the magnitude of entrainment probability) for design parameters of some types of automatic feeders		107
Ch. V. Elements of Automation (Vul'fson, I. A., Engineer and Zuzman, V. G., Engineer)		121
1. Electric motors used in machine-tool electric actuators		121
2. Control apparatus		124
Ch. VI. Systems of Automatic Control (Kovalev, P. I., Candidate of Technical Sciences and Spynu, G. A., Engineer)		146
1. Electropneumatic system of automatic control		147
2. System of program control of automatic machines using a magnetic recording		159
Ch. VII. Overall Automation of Technological Processes (Vladziyevskiy, A. P., Doctor of Technical Sciences)		163
1. General problems of line grouping		163

Card 4/15

Automation and Mechanization of (Cont.)	761	
2. Effect of shape and material of the product on the grouping of the line		166
3. Effect of component equipment on the grouping of the line		174
4. Grouping of a line for production of products such as shafts and disks		184
5. Effect of conveyers on the grouping of lines		186
6. Grouping of automatic lines for the manufacture of small parts		190
7. Methods of equalizing the productivity of individual sectors of lines		193
PART 2. MECHANIZATION AND AUTOMATION OF PART-WORKING PROCESSES		
Ch. VIII. Mechanization and Automation of Production in Foundries (Grigor'yev, B. V., Candidate of Technical Sciences)		199
1. Mechanization and automation of processes for obtaining blanks and parts from liquid metal		200
2. Casting in forms		202
3. Casting in shell molds		204

Card 5/15

Automation and Mechanization of (Cont.)	761	
4. Investment casting		205
5. Casting in ceramic and dry-sand molds		210
6. Centrifugal casting		212
7. Compression molding		217
8. Knocking down molds; cores; and cutting off and finishing castings		220
Ch. IX. Mechanization and Automation in Cold Stamping Shops (Chegodayev, A. A., Engineer)		223
1. Methods of increasing labor productivity in cold stamping		223
2. Mechanization and automation of cold-stamping processes		225
3. Mechanization of supporting operations		245
Ch. X. Mechanization and Automation of Machining Processes on General-purpose Machine Tools (Azarov, A. S., Candidate of Technical Sciences and Malov, A. N., Candidate of Technical Sciences)		248
1. Mechanization and automation of turning operations		248
2. Mechanization and automation of milling operations		260
3. Mechanization and automation of drilling and boring operations		271

Card 6/15

## Automation and Mechanization of (Cont.)

761

Ch. XI. The Use of Unit Machine Tools in Small-lot Production of Instruments (Libov, Ya. V., Engineer and Kapustin, F. D., Engineer)	273
1. Basic features of unit machine tools	274
2. Specific features of instrument parts	280
3. Features of unit machine tools designated for machining instrument parts	283
4. Brief survey and characteristic features of small-capacity headstocks	284
5. Quadrilateral standardized machine tool using a hydraulic feed	285
6. Element-by-element machining of parts	288
7. Examples of application of unit machine tools of simplified design	295
Ch. XII. Mechanization and Automation of Centerless Grinding (Dymshits, Ye. S., Engineer)	300
1. General remarks	300
2. Automatic feeders	304

Card 7/15

Automation and Mechanization of (Cont.)	761	
3. Dependence of setup stability on the solidity of grinding wheels		310
4. Parameters of stable adjustments		314
Ch. XIII. Mechanization and Automation of Galvanization Processes (Spizhernaya, O. N., Engineer and Feygel'shteyn, P. L., Engineer)		326
1. Mechanical surface finishing prior to galvanization		326
2. Galvanized coatings		333
3. Control		341
Ch. XIV. Examples of Mechanization and Automation of Instrument-parts Manufacturing Processes (Grigor'yev, B. V., candidate of Technical Sciences; Goryshin, V. V., Engineer; Levin, Z. D., Engineer; Likhachev, A. A., Candidate of Technical Sciences; Felikson, Ye. I., Candidate of Technical Sciences; and Shneyder, Yu. G., Candidate of Technical Sciences)		344
1. Automatic machines for small-diameter thread cutting		344

Card 8/15

Automation and Mechanization of (Cont.)

761

- 2. Semiautomatic thread-rolling machine with cylindrical dies IM-150 (with a mechanical feed) 348
- 3. Automatic groove-cutting machine 353
- 4. Semiautomatic gear-burnishing machine 355
- 5. Devices for mechanizing engineering processes of knife-edge manufacture 359
- 6. Automatic machine for forming tapered helical springs of varying diameter 366
- 7. Mechanized devices for the manufacture of membranes 369

PART III. MECHANIZATION AND AUTOMATION OF ASSEMBLING PROCESSES

Ch. XV. Multiproduct Production Lines (Bulovskiy, P. I., Candidate of Technical Sciences; Neymark, A. I., Candidate of Technical Sciences and Ratner, M. L., Candidate of Technical Sciences) 379

- 1. Special features of assembling processes in instrument manufacturing 379
- 2. Basic mechanization and automation trends in assembling processes in small-lot instrument production 380

Card 9/15

Automation and Mechanization of (Cont.)	761
3. Brief description of multiproduct production lines in small-lot instrument production	381
4. Trends in mechanization of multiproduct production lines	386
5. Construction of multiproduct production lines	389
Ch. XVI. Means for the Mechanization of Assembling Operations (Grigor'yev, B. V., Candidate of Technical Sciences)	397
1. Welding of parts	397
2. Soldering of parts	404
Ch. XVII. Unified Coil-winding Machines for Winding of Coils, Potentiometers and Rotors (Buyanov, I. A., Engineer)	412
1. Machine for winding on straight-line frames (series winding)	413
2. Machine for winding on arched and annular frames (toroids)	414
3. Slot-winding machines	416
4. Multispindle automatic [winding] machines	418
5. Description of standardized assemblies	419
Ch. XVIII. Equipment for Overall Mechanization of Manufacturing Processes Involving Rotor and Stators for Small-sized Electric Motors (Mironov, N. V., Engineer)	426
Card 10/15	

Automation and Mechanization of (Cont.)

761

1. Burr-removing machine 88Z-1	426
2. Apparatus for mechanical varnishing of laminated strips in magnetic circuits	429
3. Machine for stacking slot insulation	430
4. Slot-winding machines	432
Ch. XIX. Overall Mechanization of Wiring Operations During the Assembly of Electric Instruments and Units (Monakhov, A. N., Engineer)	437
1. Clamping of circuit wires on a former	437
2. Mechanization of insulation stripping from wire ends and twisting of wire strands	438
3. Machines for cutting and cleaning wire ends	441
4. Marking of wires	444
5. Use of welding in place of soldering	445
Ch. XX. Mechanization of Dynamic Balancing of Instrument and Power-unit Rotors (Borisevich, V. N., Engineer and Avrutskiy, G. I., Engineer)	447

Card 11/15

Automation and Mechanization of (Cont.)

761

- 1. Nature and significance of rotor balancing 447
- 2. Analysis of existing methods and means used in dynamic balancing 449
- 3. Equipment requirements for overall automation of the dynamic balancing process and basic trends in the solution of this problem 461

PART IV. MECHANIZATION AND AUTOMATION OF INSPECTION PROCESSES

- Ch. XXI. Automation and Mechanization of Technical Inspection Under Instrument-manufacturing Conditions (D'yachenko, I. Ye., Doctor of Technical Sciences, Professor and Vikhman, V. S., Candidate of Technical Sciences)
  - 1. Basic data for the selection of preventive control methods 467
  - 2. Automatic inspection devices 468
  - 3. Inspection with the aid of radioactive isotopes 470  
478
- Ch. XXII. Means for Automatic Inspection of Parts (Kiselev, V.M., Candidate of Technical Sciences and Polyakov, Z. S., Engineer)
  - 1. Electric means for automatic inspection 481  
481

Card 12/15

Automation and Mechanization of (Cont.)	761
2. Pneumatic means for automatic inspection	491
Ch. XXIII. Automating Inspection of Small-module Gears (Kozlov, M. P., Engineer)	506
1. Objectives of automating gear-inspection processes	506
2. Feasibility of automating overall double-profile inspection	507
3. Feasibility of automating single-profile inspection	511
Ch. XXIV. Automating Inspection of Thread-cutting in Instrument Manufacturing (Gavrilov, A. N., Doctor of Technical Sciences, Professor and Khokhlov, B. A., Candidate of Technical Sciences)	518
1. Objective and significance of automating and mechanizing the inspection of thread-cutting operations	518
2. Instruments and devices mechanizing the control of thread-cutting process	520
3. Automatic machines for inspecting and sorting of threaded parts.	530
4. Automatic inspection machines for checking thread cutting in process	533
Card 13/15	

## Automation and Mechanization of (Cont.)

761

- Ch. XXV. Automating Inspection of Knife-edges (Felikson, Ye. I.,  
Candidate of Technical Sciences)
1. Instruments for inspecting the angle of paper 536
  2. Instrument for inspecting prism's working edge 537
  3. Instrument for inspecting the cut face of the cone  
prism 544
- 549
- Ch. XXVI. Automating Inspection of Parts of a Magnetic circuit  
Relay (Zhigalov, A. A., Engineer)
1. Methods of measuring magnetic characteristics and inspection of  
magnetic properties of relay parts. 554
  2. Basic data on setting up a semiautomatic device. 557
  3. Principle of operation of the semiautomatic device 559
  4. Description of the system and operations of the semiautomatic  
device 561
  5. Rating data and validating elements of the semiautomatic-  
device system 567
  6. Design description and equipment composition of the semi-  
automatic device 569
  7. Economic effect resulting from the use of the semiautomatic  
device 570
- Card 14/15

Automation and Mechanization of (Cont.)	761
8. Prospects for refining the semiautomatic device and its use for other purposes	571
Ch. XXVII. Mechanization and Automation of Inspection Processes and Accounting of Parts in the Watch-making Industry (Sarkin, V. I., Candidate of Technical Sciences and Vorntsov, L. N. Candidate of Technical Sciences)	572
1. Universal dimension-control means and examples of their mechanization and automation	572
2. Mechanizing the inspection of surface finish	576
3. Mechanized and automatic devices for inspecting watch parts	576
4. Counters for watch parts	586
5. Activating devices	589
