Chizhikov, D.M., G.N. Zviadladze, L.A. Ogurtsova, and I.N. Karyazina (Institute of Metallurgy, Academy of Sciences USSR). A Cyclic Method for the Electrolytic Production of Titanium From a Fused Mixture of Chlorides of Sodium and Potassium, p. 113. Titan i yego splavy. vyp. II: Metallurgiya titana (Titanium and Its Alloys. No. 2: Metallurgy of Titanium) Moscow, Izd-vo AN SSSR, 1959. 179 p.

This collection of papers deals with sources of titanium; production of titanium dioxide, metallic titanium, and titanium sheet; slag composition; determination of titanium content in slags; and other related matters. The sources of titanium discussed are the complex sillimanite ores of the Kyakhtinskoye Deposit (Buryatskaya ASSR) and certain aluminum ores of Eastern Siberia. One paper explains the advantages of using ilmenite titanium slags for the production of titanium dioxide by the sulfuric acid method. Production of metallic titanium by thermal reduction processes (hydrogen, magnesium, and carbon reduction) is the subject of several papers, while other papers are concerned with the electrolytic production of titanium. Other subjects dealt with are interaction of titanium with water vapor and with hydrogen and the determination of titanium in slags.

TITLE: The Reaction of Titanium With Its Tetrachloride (Vzaimodeystviye titana s yego tetrakhloridom)

PERIODICAL: Tr. In-ta metallurgii AN SSSR, 1957, Nr 1, pp 85-92

ABSTRACT: A study of the conditions necessary for the formation of the lowest chlorides produced by the reaction of Ti with $TiCl_4$. Twice distilled $TiCl_4$ was employed in the experiments. The powdered Ti, a metal obtained by means of magnesium-thermal process followed by vacuum distillation, contained 99.7 percent Ti. The partial pressure of the $TiCl_4$ was computed from its loss in the vessel and from the volume of Ar passed in the course of the experiment. The purification of Ar was accomplished by passing it through a layer of Ti-sponge heated to a temperature of $700^\circ - 800^\circ$. Prior to the introduction of the $TiCl_4$ vapors, Ar was blown through the cold reaction tube. The furnace was then turned on and the $TiCl_4$ was introduced into the tube after the necessary experimental temperature was reached. After the

Card 1/2

137-1957-12-23487

The Reaction of Titanium With Its Tetrachloride

completion of the reaction, the reaction products were extracted from the tube in an Ar stream and were then investigated. It was established that the reaction of Ti with $TiCl_4$ is affected by the temperature and by the partial pressure of $TiCl_4$. At temperatures between 300 and 500° the reaction produces $TiCl_2$, whereas higher temperatures produce $TiCl_3$ along with $TiCl_2$. The most likely reaction between Ti and $TiCl_4$ in the range investigated (300 - 900°) is described by the formula:

1. Titanium reaction 2. Tetrachloride-Applications

TITLE: On the Evaporation of Selenium From Its Sulfur Alloys (Ob
isparenii selena iz yego splavov s seroy)

PERIODICAL: Tr. In-ta metallurgii AN SSSR, 1957, Nr 1, pp 93-100

ABSTRACT: A presentation of experimental results of an investigation of the rate of evaporation of Se from its S alloys, as well as on the condensation of Se from a vapor phase composed of Se and S. Synthetic alloys of S and Se were employed in the experiment; they were obtained by adding appropriate quantities of both stable and active Se to molten S, while the latter was being constantly stirred. The measurement of the evaporation rate of the components of the S-Se alloys was carried out within a temperature range of 98-400°, both under atmospheric pressure and in a vacuum. The rate of evaporation of S and of Se in their alloys increases with temperature. In the sublimation of the solid alloy at 98° the composition of the vapor corresponds to the composition of the solid phase. In the evaporation of the liquid alloy the vapor phase contains approximately one-half as much Se as

Card 1/2

137-1957-12-23279

On the Evaporation of Selenium From Its Sulfur Alloys

the liquid phase. During the distillation of the alloy at low temperatures (under vacuum) and at higher temperatures (under atmospheric pressures) the ratio of the separation remains approximately constant ($C_{alloy}/C_{vapor} = 1.3-2$). On the strength of the data obtained it was concluded that complex, polyatomic molecules, containing atoms of both components, are formed in the alloys of S and Se.

Title : Study of Equilibrium Liquid-Vapor in Sulphur-Selenium System.

Orig Pub: Zh. neorgan. khimii, 1957, 2, No 7, 1581-1586.

Abstract: The partial pressures of S and Se vapors on their fuses at 250° were determined by the flow method. The positive divergence of the pressure curve of Se vapor and the great values of Se activity in fuses with S indicate the formation of chemical compounds. At a temperature rise, the behavior of S-Se system fuses approaches the behavior of solutions, the components of which do not produce chemical compounds.

TITLE: Reaction Between Titanium Tetrachloride and Titanium Dioxide in the Presence of Carbon

PERIODICAL: Tsvetnyye metally, 1960, No. 12, pp. 42-46

TEXT: The basic reaction in the chlorine process, which is increasingly used in the production of titanium, is:

Whatever modification of the process is employed, secondary reactions take place between titanium tetrachloride and metallic oxide. Rational control of the process is not possible without proper understanding of these reactions, one of which was the object of the present investigation. The experiments consisted in heating a TiO_2 -C powder compact in a stream of titanium tetrachloride, mixed in various proportions with dry argon. It was established that under these conditions titanium trichloride and carbon monoxide are formed. The formation of titanium trichloride begins at 900°C and its rate increases with rising

Card 1/3

Reaction Between Titanium Tetrachloride and Titanium Dioxide in
the Presence of Carbon

temperature. The process can be intensified by increasing the partial pressure of titanium tetrachloride in the $TiCl_4$ -A mixture up to 300 mm Hg; further increase in the partial pressure of $TiCl_4$ brings about only a small increase in the yield of $TiCl_3$. Maximum yield of this compound is obtained when titanium dioxide and carbon are present in equal molar proportions. It was inferred from the experimental data on the kinetics of the process studied, that it constitutes a multi-stage reaction which can be represented by:

Card 2/3

S/136/60/000/012/004/010
E193/E183

Reaction Between Titanium Tetrachloride and Titanium Dioxide in
the Presence of Carbon

The results of the present investigation indicate that when the chlorine process is used for treatment of titanium-bearing materials, $TiCl_3$, formed as a result of the secondary reactions, may reduce the yield of titanium tetrachloride. The presence of $TiCl_3$ in gases leaving the chlorinator may cause complications during subsequent condensation. When chlorine is made to react with molten material, losses of titanium and chlorine may occur as a result of dissolution of $TiCl_3$ in $TiCl_4$. On the other hand, the results of the present investigation may provide a basis of a process for production of titanium trichloride which, by itself, is a valuable material.

TITLE: Reduction of rubidium chloride by calcium-silicon

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 2, 1966, 433-436

TOIPC TAGS: rubidium compound, calcium compound, electrochemical analysis, chemical reaction kinetics, activation energy

ABSTRACT: The reaction of RbCl with calcium-silicon containing 67% CaSi₂ can be expressed in the form of a final reaction: 2RbCl + CaSi₂ = CaCl₂ + 2Rb (1). The Rb was sublimated in vacuum in the form of vapors. The process of this reaction was studied by (1) continuous registration of the decrease in the charge weight at constant temperature, and (2) electrochemically by determining the polarization of the calcium silicon electrode in RbCl (polarization current curves vs the value of polarization). The 2 g briquets (15 mm in diameter and 4.5 mm in thickness), which were made by compression at 1000-7500 kg/cm² of the mixtures of calcium silicon and RbCl, were used in the first method, and in the second method liquid calcium silicon was charged into a porcelain tube containing RbCl. The kinetic curves were plotted (degree of reduction vs time) to characterize the reduction of RbCl (1) at 700C in vacuum (2-3 x 10⁻² mm Hg)

Card 1/2

ACC NR: AP6019053

under various ratios of $\text{CaSi}_2 : \text{RbCl}$, and (2) in an Ar atmosphere at 750C and at various residual pressures of Ar (1, 5, and 10 mm Hg). The changes of the $\text{CaSi}_2 : \text{RbCl}$ ratio within a wide range had little effect on the reduction of RbCl . Therefore, all subsequent experiments were made at $\text{CaSi}_2 : \text{RbCl} = 3$. The changes in pressure during briquetting also did not change the reaction parameters. The separate placement of a layer of RbCl under a layer of calcium silicon resulted in a noticeable decrease in the rate of reduction. It was thus concluded that the reduction of RbCl occurred mostly by the reaction of calcium silicon with liquid RbCl . The optimal conditions were achieved during the two-stage reduction: (1) reduction at 750C in Ar atmosphere under an Ar pressure of 5 mm Hg, and (2) creation of a vacuum in the system and further reduction at 900C. About 70% Rb was reduced during the two-stage process. The RbCl which evaporated during reduction concentrated separately from the metal and was recirculated. The two-stage reduction occurred practically without permanent losses of RbCl . The second set of experiments (electrochemical) suggested that the reaction on the boundary of calcium silicon and RbCl occurred in two stages: $\text{CaSi}_2 \rightarrow \text{Ca}^{2+} + 2\text{Si} + 2e^-$ and $2\text{Rb}^+ + 2e^- \rightarrow 2\text{Rb}$. The reaction (1) can therefore be considered as the result of the work of a shortcircuited cell. The anode oxidation of the negative Si ions and the cathode reduction of Rb occurred in this cell. The calculation of apparent energy of activation made from polarization curves yielded a value ($E = 19,200 \text{ cal/mole}$) nearly similar to that of the apparent energy of activation obtained from the kinetic data of the first set of experiments. TITLE: Contribution to the theory of dynamic polarization and relaxation of nuclei
in the case of strong saturation

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 2919-2924

TOPIC TAGS: nuclear polarization, spin lattice relaxation, nuclear spin, electron
spin, electron spin, quantum statistics, paramagnetic relaxation, *electron polarization*

ABSTRACT: The relaxation and dynamic polarization of nuclei, resulting from
paramagnetic impurities, are investigated on the basis of quantum statistics in the
case when a strong radio-frequency field is applied to a system of electron spins.
The interaction between the electron and nuclear spin subsystems is regarded as a small
perturbation. The analysis is based on the construction of the nonequilibrium density
matrix by the method developed by D. N. Zubarev (DAN SSSR v. 140, p. 2, 1961). The
analysis is limited to the quasistatic case, with the dispersion of the kinetic coef-
ficients neglected. The correlators of the spin operators are calculated. It is
shown that the relaxation time increases near resonance, for then exchange of energy
between the electron and nuclear systems is greatly reduced. The results indicate

Card 1/2

ACC NR: AP6033551

that with increasing amplitude of the radio-frequency field the degree of polarization increases (the temperature of the nuclear subsystem decreases), goes through a maximum, and then decreases. A relation is established between the spin-lattice relaxation time and the position of the maximum. Orig. art. has: 45 formulas.

Determination of sulfur dioxide in air by polarography.
E. Zvingi-Selcean, L. Carjat, and N. Răguzeanu. *Rev. Chim.* (Bucharest) **9**, 39-44 (1958).—A comparative study was carried out to det. SO₂ in air by polarography, colorimetry, iodometry, conductometry, and nephelometry. The SO₂ was absorbed in water or in a 5% soln. of ale, sugar, or glycerol, and polarographed in the presence of air, from a soln. contg. 3 ml. 0.1N HCl 5 ml., into which 2 drops of 0.1% methyl red was added. The sensitivity limits for the 5 methods were: 0.8 γ for colorimetry, 2 γ for nephelometry, 10 γ for conductometry and potentiometry, and 14 γ SO₂ for iodometry. Only the nephelometric and polarographic procedures are specific for SO₂. 10 references. R. M.

TITLE: Formation and Dissolution of Heterogeneous Regions in Single Crystals of Solid Solutions (K,Na) Cl

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 10, pp. 2370-2383

TEXT: The decomposition and rehomogenization of solid solutions of (K,Na)Cl whose compositions are nearly in equimolar proportion, were studied here by three methods; 1) By Laue diffraction patterns. 2) By microscopic studies with linearly polarized light in which the time variation of brightness was investigated. 3) By photometric investigations of the opacifying of crystals of solid solutions. In the individual sections of the paper, the authors discuss the changes during decomposition and rehomogenization of the solid solutions in: Laue diagram, state of elastic stresses of the single crystal of equimolar solutions at the beginning of the decomposition, the opacifying of the crystal of equimolar solutions on decomposition, and the relations between the effects observed and their interpretation. Results relating to the time variation and the

Card 1/2

Formation and Dissolution of Heterogeneous Regions in Single Crystals of Solid Solutions (K,Na) Cl S/181/60/002/010/006/051 B019/B070

dependence on temperature of the effects observed lead to the conclusion that the decomposition of the solutions studied here takes place in two stages. In the first stage there appears a spontaneous formation of local heterogeneous regions which are microscopically small. In the second stage, there occurs a recrystallization of the equilibrium phase. The microscopically small regions formed in the first stage grow at the cost of others having the same composition. The stresses between these heterogeneous regions formed in the first stage and their surroundings decrease in the second stage by the growth of the heterogeneous region. The continuity and disorientation are destroyed in the heterogeneous region. Heating of the disintegrated solution above the solubility temperature T_s results in a dissolution of the heterogeneous regions, that is, a rehomogenization takes place. There are 11 figures, 1 table, and 26 references: 5 Soviet, 3 Dutch, 9 German, 7 US, 1 British, and 1 Indian.

TITLE:

An X-ray Crystallographic Study of the Polymorphism of
 Nb_2O_5 (Rentgenograficheskoye issledovaniye polimorfizma
 Nb_2O_5)

PERIODICAL: Kristallografiya, 1958, Vol 3, Nr 6, pp 744 - 747/(USSR) + 1 plate
ABSTRACT: The three forms of Nb_2O_5 were found to have the unit cells:

Indexed powder data for the α and β forms are given.
Diffraction symmetry is given in Table I, p 745.

A crystalline preparation of $\alpha-Nb_2O_5$ was made by

heating on a Pt wire using the reaction $2NbCl_5 +$

The temperature was
1 100 - 1 300 °C. After 2 hours at 1 450 °C, the specimen
became transparent and crystals big enough for X-ray work
were obtained. A de Jong-Bouman camera was used to find
the mutual orientation of the crystallites in the star or
octagonal growths. Each growth contained 8 crystals in.

REMARKS: This collection of articles is intended for engineers

dealing with the problem of machine vibrations.

CONTENTS: The collection contains works which were originally

presented at the Soviet Scientific Seminar "Prochnost' Instituta

Mashinostroyeniya AN SSSR (Scientific Council and Scientific Council for

Strength Research) of the Institute of Machine Construction Problems of

Academy of Sciences of USSR. In 1955. Some of the problems

are investigated in connection with machine vibrations or

flexible rotors taking vibration into account, the effect

of impulses on flexible转子 connected to the engine, vibra-

tion of a system with clearance, determination of frequency

and mode of free vibrations of various representations based

on means of special functions and the calculation of self-

excited vibrations in a computer system. No personalities

are mentioned. References to many individual articles.

Increasing the wear resistance of steel castings. Lit.proizv. no.4:37-38
Ap '63. (MIRA 16:4)

(Steel castings)

(Surface hardening)

AUTHORS: Mikhaylov, A.M., Gorbul'skij, G.F., Zvirbulis, I.A.

TITLE: Improving the wear resistance of steel castings

PERIODICAL: Liteynoye proizvodstvo, no. 4, 1963, 37 - 38

TEXT: For this purpose the metal surface is alloyed with carbon-containing ferro-chrome or manganese. Tests were carried out to improve this wear-resistant alloy by addition of 4% corundum to the conventional alloy. The new casting was studied on sample and traction parts, in comparison with the standard and with the latter with the alloyed surfaces. The results are given in the following table. The standard "ferro-chrome" casting has a higher resistance to wear than the standard "manganese" casting. The resistance to wear of the new casting is slightly higher than that of the standard casting. The resistance to wear of the new casting is slightly higher than that of the standard casting.

Card 1/2

Improving the wear resistance of steel castings

S/128/63/000/004/C03/C04

ed with a dense 2 - 3 mm thick metal-corundum coating that formed a tight bond with the base metal. The wear of the corundum-coated track links was by a factor of 2.8 less than that on links coated with the conventional alloy. After 50 h operation the wear of the conventional track links was 1 - 2 mm, whereas no wear could be found on the experimental ones. If more than 6% corundum is added to the coating mixture, the efficiency of the coating layer deteriorates, most probably due to disintegration of the alloy in which case the corundum particles liberated promote the wear of the metal. There are 5 figures.

Chizhikov, D.M., G.N. Zviadladze, L.A. Ogurtsova, and I.N. Karyazina (Institute of Metallurgy, Academy of Sciences USSR). A Cyclic Method for the Electrolytic Production of Titanium From a Fused Mixture of Chlorides of Sodium and Potassium, p. 113. Titan i yego splavy. vyp. II: Metallurgiya titana (Titanium and Its Alloys. No. 2: Metallurgy of Titanium) Moscow, Izd-vo AN SSSR, 1959. 179 p.

This collection of papers deals with sources of titanium; production of titanium dioxide, metallic titanium, and titanium sheet; slag composition; determination of titanium content in slags; and other related matters. The sources of titanium discussed are the complex sillimanite ores of the Kyakhtinskoye Deposit (Buryatskaya ASSR) and certain aluminum ores of Eastern Siberia. One paper explains the advantages of using ilmenite titanium slags for the production of titanium dioxide by the sulfuric acid method. Production of metallic titanium by thermal reduction processes (hydrogen, magnesium, and carbon reduction) is the subject of several papers, while other papers are concerned with the electrolytic production of titanium. Other subjects dealt with are interaction of titanium with water vapor and with hydrogen and the determination of titanium in slags.

TITLE: The Reaction of Titanium With Its Tetrachloride (Vzaimodeystviye titana s yego tetrakhloridom)

PERIODICAL: Tr. In-ta metallurgii AN SSSR, 1957, Nr 1, pp 85-92

ABSTRACT: A study of the conditions necessary for the formation of the lowest chlorides produced by the reaction of Ti with $TiCl_4$. Twice distilled $TiCl_4$ was employed in the experiments. The powdered Ti, a metal obtained by means of magnesium-thermal process followed by vacuum distillation, contained 99.7 percent Ti. The partial pressure of the $TiCl_4$ was computed from its loss in the vessel and from the volume of Ar passed in the course of the experiment. The purification of Ar was accomplished by passing it through a layer of Ti-sponge heated to a temperature of $700^\circ - 800^\circ$. Prior to the introduction of the $TiCl_4$ vapors, Ar was blown through the cold reaction tube. The furnace was then turned on and the $TiCl_4$ was introduced into the tube after the necessary experimental temperature was reached. After the

Card 1/2

137-1957-12-23487

The Reaction of Titanium With Its Tetrachloride

completion of the reaction, the reaction products were extracted from the tube in an Ar stream and were then investigated. It was established that the reaction of Ti with $TiCl_4$ is affected by the temperature and by the partial pressure of $TiCl_4$. At temperatures between 300 and 500° the reaction produces $TiCl_2$, whereas higher temperatures produce $TiCl_3$ along with $TiCl_2$. The most likely reaction between Ti and $TiCl_4$ in the range investigated (300 - 900°) is described by the formula:

TITLE: On the Evaporation of Selenium From Its Sulfur Alloys (Ob
isparenii selena iz yego splavov s seroy)

PERIODICAL: Tr. In-ta metallurgii AN SSSR, 1957, Nr 1, pp 93-100

ABSTRACT: A presentation of experimental results of an investigation of the rate of evaporation of Se from its S alloys, as well as on the condensation of Se from a vapor phase composed of Se and S. Synthetic alloys of S and Se were employed in the experiment; they were obtained by adding appropriate quantities of both stable and active Se to molten S, while the latter was being constantly stirred. The measurement of the evaporation rate of the components of the S-Se alloys was carried out within a temperature range of 98-400°, both under atmospheric pressure and in a vacuum. The rate of evaporation of S and of Se in their alloys increases with temperature. In the sublimation of the solid alloy at 98° the composition of the vapor corresponds to the composition of the solid phase. In the evaporation of the liquid alloy the vapor phase contains approximately one-half as much Se as

Card 1/2

137-1957-12-23279

On the Evaporation of Selenium From Its Sulfur Alloys

the liquid phase. During the distillation of the alloy at low temperatures (under vacuum) and at higher temperatures (under atmospheric pressures) the ratio of the separation remains approximately constant ($C_{\text{alloy}}/C_{\text{vapor}} = 1.3-2$). On the strength of the data obtained it was concluded that complex, polyatomic molecules, containing atoms of both components, are formed in the alloys of S and Se.

Title : Study of Equilibrium Liquid-Vapor in Sulphur-Selenium System.

Orig Pub: Zh. neorgan. khimii, 1957, 2, No 7, 1581-1586.

Abstract: The partial pressures of S and Se vapors on their fuses at 250° were determined by the flow method. The positive divergence of the pressure curve of Se vapor and the great values of Se activity in fuses with S indicate the formation of chemical compounds. At a temperature rise, the behavior of S-Se system fuses approaches the behavior of solutions, the components of which do not produce chemical compounds.

TITLE: Reaction Between Titanium Tetrachloride and Titanium Dioxide in the Presence of Carbon

PERIODICAL: Tsvetnyye metally, 1960, No. 12, pp. 42-46

TEXT: The basic reaction in the chlorine process, which is increasingly used in the production of titanium, is:

Whatever modification of the process is employed, secondary reactions take place between titanium tetrachloride and metallic oxide. Rational control of the process is not possible without proper understanding of these reactions, one of which was the object of the present investigation. The experiments consisted in heating a TiO_2 -C powder compact in a stream of titanium tetrachloride, mixed in various proportions with dry argon. It was established that under these conditions titanium trichloride and carbon monoxide are formed. The formation of titanium trichloride begins at 900°C and its rate increases with rising

Card 1/3

S/136/60/000/012/004/010

Reaction Between Titanium Tetrachloride and Titanium Dioxide in
the Presence of Carbon

temperature. The process can be intensified by increasing the partial pressure of titanium tetrachloride in the $TiCl_4$ -A mixture up to 300 mm Hg; further increase in the partial pressure of $TiCl_4$ brings about only a small increase in the yield of $TiCl_3$. Maximum yield of this compound is obtained when titanium dioxide and carbon are present in equal molar proportions. It was inferred from the experimental data on the kinetics of the process studied, that it constitutes a multi-stage reaction which can be represented by:

Card 2/3

S/136/60/000/012/004/010
E193/E183

Reaction Between Titanium Tetrachloride and Titanium Dioxide in
the Presence of Carbon

The results of the present investigation indicate that when the chlorine process is used for treatment of titanium-bearing materials, $TiCl_3$, formed as a result of the secondary reactions, may reduce the yield of titanium tetrachloride. The presence of $TiCl_3$ in gases leaving the chlorinator may cause complications during subsequent condensation. When chlorine is made to react with molten material, losses of titanium and chlorine may occur as a result of dissolution of $TiCl_3$ in $TiCl_4$. On the other hand, the results of the present investigation may provide a basis of a process for production of titanium trichloride which, by itself, is a valuable material.

There are 6 figures and 2 tables.

TITLE: Reduction of rubidium chloride by calcium-silicon

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 2, 1966, 433-436

TOIPC TAGS: rubidium compound, calcium compound, electrochemical analysis, chemical reaction kinetics, activation energy

ABSTRACT: The reaction of RbCl with calcium-silicon containing 67% CaSi₂ can be expressed in the form of a final reaction: 2RbCl + CaSi₂ = CaCl₂ + 2Rb (1). The Rb was sublimated in vacuum in the form of vapors. The process of this reaction was studied by (1) continuous registration of the decrease in the charge weight at constant temperature, and (2) electrochemically by determining the polarization of the calcium silicon electrode in RbCl (polarization current curves vs the value of polarization). The 2 g briquets (15 mm in diameter and 4.5 mm in thickness), which were made by compression at 1000-7500 kg/cm² of the mixtures of calcium silicon and RbCl, were used in the first method, and in the second method liquid calcium silicon was charged into a porcelain tube containing RbCl. The kinetic curves were plotted (degree of reduction vs time) to characterize the reduction of RbCl (1) at 700C in vacuum (2-3 x 10⁻² mm Hg)

Card 1/2

UDC: 546.351131 : 542.942

ACC NR: AP6019053

under various ratios of $\text{CaSi}_2 : \text{RbCl}$, and (2) in an Ar atmosphere at 750C and at various residual pressures of Ar (1, 5, and 10 mm Hg). The changes of the $\text{CaSi}_2 : \text{RbCl}$ ratio within a wide range had little effect on the reduction of RbCl . Therefore, all subsequent experiments were made at $\text{CaSi}_2 : \text{RbCl} = 3$. The changes in pressure during briquetting also did not change the reaction parameters. The separate placement of a layer of RbCl under a layer of calcium silicon resulted in a noticeable decrease in the rate of reduction. It was thus concluded that the reduction of RbCl occurred mostly by the reaction of calcium silicon with liquid RbCl . The optimal conditions were achieved during the two-stage reduction: (1) reduction at 750C in Ar atmosphere under an Ar pressure of 5 mm Hg, and (2) creation of a vacuum in the system and further reduction at 900C. About 70% Rb was reduced during the two-stage process. The RbCl which evaporated during reduction concentrated separately from the metal and was recirculated. The two-stage reduction occurred practically without permanent losses of RbCl . The second set of experiments (electrochemical) suggested that the reaction on the boundary of calcium silicon and RbCl occurred in two stages: $\text{CaSi}_2 \rightarrow \text{Ca}^{2+} + 2\text{Si} + 2e^-$ and $2\text{Rb}^+ + 2e^- \rightarrow 2\text{Rb}$. The reaction (1) can therefore be considered as the result of the work of a shortcircuited cell. The anode oxidation of the negative Si ions and the cathode reduction of Rb occurred in this cell. The calculation of apparent energy of activation made from polarization curves yielded a value ($E = 19,200 \text{ cal/mole}$) nearly similar to that of the apparent energy of activation obtained from the kinetic data of the first set of experiments. TITLE: Contribution to the theory of dynamic polarization and relaxation of nuclei
in the case of strong saturation

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 2919-2924

TOPIC TAGS: nuclear polarization, spin lattice relaxation, nuclear spin, electron
spin, electron spin, quantum statistics, paramagnetic relaxation, *electron polarization*

ABSTRACT: The relaxation and dynamic polarization of nuclei, resulting from
paramagnetic impurities, are investigated on the basis of quantum statistics in the
case when a strong radio-frequency field is applied to a system of electron spins.
The interaction between the electron and nuclear spin subsystems is regarded as a small
perturbation. The analysis is based on the construction of the nonequilibrium density
matrix by the method developed by D. N. Zubarev (DAN SSSR v. 140, p. 2, 1961). The
analysis is limited to the quasistatic case, with the dispersion of the kinetic coef-
ficients neglected. The correlators of the spin operators are calculated. It is
shown that the relaxation time increases near resonance, for then exchange of energy
between the electron and nuclear systems is greatly reduced. The results indicate

Card 1/2

ACC NR: AP6033551

that with increasing amplitude of the radio-frequency field the degree of polarization increases (the temperature of the nuclear subsystem decreases), goes through a maximum, and then decreases. A relation is established between the spin-lattice relaxation time and the position of the maximum. Orig. art. has: 45 formulas.

Determination of sulfur dioxide in air by polarography.
E. Zvingi-Selcean, L. Carjat, and N. Răguzeanu. *Rev. Chim.* (Bucharest) **9**, 39-44 (1958).—A comparative study was carried out to det. SO₂ in air by polarography, colorimetry, iodometry, conductometry, and nephelometry. The SO₂ was absorbed in water or in a 5% soln. of ale, sugar, or glycerol, and polarographed in the presence of air, from a soln. contg. 3 ml. 0.1N HCl 5 ml., into which 2 drops of 0.1% methyl red was added. The sensitivity limits for the 5 methods were: 0.8 γ for colorimetry, 2 γ for nephelometry, 10 γ for conductometry and potentiometry, and 14 γ SO₂ for iodometry. Only the nephelometric and polarographic procedures are specific for SO₂. 10 references. R. M.

TITLE: Formation and Dissolution of Heterogeneous Regions in Single Crystals of Solid Solutions (K,Na) Cl

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 10, pp. 2370-2383

TEXT: The decomposition and rehomogenization of solid solutions of (K,Na)Cl whose compositions are nearly in equimolar proportion, were studied here by three methods; 1) By Laue diffraction patterns. 2) By microscopic studies with linearly polarized light in which the time variation of brightness was investigated. 3) By photometric investigations of the opacifying of crystals of solid solutions. In the individual sections of the paper, the authors discuss the changes during decomposition and rehomogenization of the solid solutions in: Laue diagram, state of elastic stresses of the single crystal of equimolar solutions at the beginning of the decomposition, the opacifying of the crystal of equimolar solutions on decomposition, and the relations between the effects observed and their interpretation. Results relating to the time variation and the

Card 1/2

BO19/BO70

dependence on temperature of the effects observed lead to the conclusion that the decomposition of the solutions studied here takes place in two stages. In the first stage there appears a spontaneous formation of local heterogeneous regions which are microscopically small. In the second stage, there occurs a recrystallization of the equilibrium phase. The microscopically small regions formed in the first stage grow at the cost of others having the same composition. The stresses between these heterogeneous regions formed in the first stage and their surroundings decrease in the second stage by the growth of the heterogeneous region. The continuity and disorientation are destroyed in the heterogeneous region. Heating of the disintegrated solution above the solubility temperature T_s results in a dissolution of the heterogeneous regions, that is, a rehomogenization takes place. There are 11 figures, 1 table, and 26 references: 5 Soviet, 3 Dutch, 9 German, 7 US, 1 British, and 1 Indian.

TITLE:

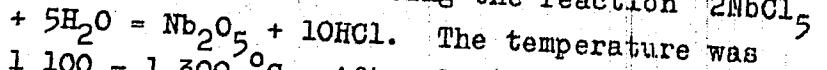

An X-ray Crystallographic Study of the Polymorphism of
 Nb_2O_5 (Rentgenograficheskoye issledovaniye polimorfizma
 Nb_2O_5)

PERIODICAL: Kristallografiya, 1958, Vol 3, Nr 6, pp 744 - 747/(USSR) + 1 plate
ABSTRACT: The three forms of Nb_2O_5 were found to have the unit cells:

Indexed powder data for the α and β forms are given.
Diffraction symmetry is given in Table I, p 745.

A crystalline preparation of $\alpha-Nb_2O_5$ was made by
heating on a Pt wire using the reaction $2NbCl_5 +$

The temperature was
1 100 - 1 300 °C. After 2 hours at 1 450 °C, the specimen
became transparent and crystals big enough for X-ray work
were obtained. A de Jong-Bouman camera was used to find
the mutual orientation of the crystallites in the star or
octagonal growths. Each growth contained 8 crystals in.

REMARKS: This collection of articles is intended for engineers

dealing with the problem of machine vibrations.

CONTENTS: The collection contains works which were originally

presented at the Soviet Scientific Seminar "Prochnost' Instituta

Mashinostroyeniya AN SSSR (Scientific Council and Scientific Council for

Strength Research) of the Institute of Machine Construction Problems of

Academy of Sciences of USSR. In 1955. Some of the problems

are investigated in connection with machine vibrations or

flexible rotors taking vibration into account, the effect

of impulses on flexible转子 connected to the engine, vibra-

tion of a system with clearance, determination of frequency

and mode of free vibrations of various representations based

on means of special functions and the calculation of self-

excited vibrations in a computer system. No personalities

are mentioned. References to many individual articles.

ed with a dense 2 - 3 mm thick metal-corundum coating that formed a tight bond with the base metal. The wear of the corundum-coated track links was by a factor of 2.8 less than that on links coated with the conventional alloy. After 50 h operation the wear of the conventional track links was 1 - 2 mm, whereas no wear could be found on the experimental ones. If more than 6% corundum is added to the coating mixture, the efficiency of the coating layer deteriorates, most probably due to disintegration of the alloy in which case the corundum particles liberated promote the wear of the metal. There are 5 figures.

Mutual displacement of metals from the vapours of their salts and the application of this process in the fight against corrosion. N. A. ZVIAGINTSEV and E. S. SARKISOV (Compt. rend. Acad. Sci. U.R.S.S., 1938, 18, 437-440).—Specimens of Armco Fe and of Cr were placed adjacent to one another in a tube furnace and heated in dry HCl at 875-1100°. The CrCl_3 formed was decomposed on the Fe, forming lustrous Cr coatings of controllable thickness, which were resistant to aq. NaCl, moist $\text{H}_2\text{S} + \text{CO}_2 + \text{air}$, N-HNO_3 , and x-AcOH . With $\text{x-H}_2\text{SO}_4$ there was a small evolution of H_2 . With a similar technique, W gives lustrous coatings on Fe, and Ni grey crumbly deposits. Deposition of Ni and Cr together gave lustrous durable coatings.

"The Influence of Food Intake Frequency on Body Proportions and
the Thickness of Epithelium in School Children."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 83-84

Abstract: In grown-ups infrequent heavy meals increase fat deposition. 226 children, aged 6 - 16 were given 2874-2970 calories per day in 3, 5 or 7 meals. In the age group 11 - 16 3 meals a day led to an increase of weight; in the younger group no difference was found. The epithelium was thicker in the children with increased weight. 4 Western, 4 Czech references. Submitted at "16 Days of Physiology" at Kosice, 30 Sep 65.

TITLE: A time relay

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,
no. 9, 1962, abstract 9-2-35 b (Czech. pat., cl. 21c,
44, no. 97831, December 15, 1960)

TEXT: An a.c. relay circuit, providing for control of the drop-out time is patented. The circuit is characterized by a condenser connected in series or in parallel to the winding of the energized relay, forming a resonant circuit, which in its turn is connected in series with a variable resistor. The resonant circuit is shunted by a thermistor in series with a second variable resistor. The resistors are used for controlling the drop-out time of the relay.
