"Experimental Study of Thermodynamic Properties of Berillium Oxide in Liquid and Solid Phases"

Teplofizika Vysokikh Temperatur, Vol 9, No 5, 1971, pp 926-928.

Abstract: A mixing method using a calorimeter with an evaporating liquid is used to measure the enthalpy of berillium oxide in liquid and solid phases in the 2,000-3,200°K interval. The material studied was under its own vapor pressure in sealed ampules of tungsten and molybdenum. The results of measurements are used to produce the heat of melting and heat capacity of the liquid phase of berillium oxide, which have not been published previously in the literature.

"Changes in Auditory Analyzer Functions in Personnel Working at Control Desks
Involving Perception of Spoken Information"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 7, Jul 70, pp 32-
35

Abstract: Shifts with time in the level of auditory sensitivity of dispatchers
and announcers working at airports and for the Moscow telephone system were
studied during a workday. The greatest volume of auditory information was
handled by dispatchers in the airport control tower; their work involved
radio transmission and reception. For the other workers studied, information
transfer was by telephone. The airport dispatcher must keep track of the move-
ment of airplanes and may have to retain a great deal of information from
radio transmissions and radar screens. It was found that in all of the groups
tested, the differential capability of the auditory analyzer was reduced during
the workday. The qualitative and quantitative characteristics of these shifts
were specifically related to the bulk of information and the transmission

Jul 70, pp 32-35

channels. In radio reception, the change in auditory sensitivity was characterized by an increase in tonal thresholds over a wide frequency range (from 125 to 2000 cycles). In the reception of information over a telephone, a decrease in auditory sensitivity was observed within a narrow frequency range (around 2000 cycles). In persons occupied in intellectual work without any interference with the auditory analyzer, a decrease in auditory sensitivity was likewise observed; in this case, the shifts were uniform over the entire audio range (from 125 to 10,000 cycles). These data indicate that shifts in auditory perception can be brought about either by specific loads (such as perception of spoken words through radio or telephone) or as a result of general fatigue produced by strenuous mental work. The frequency range affected will vary in the different cases.

"Synthesis and Some Conversions of Polyfluorinated Indandiones-1,3. II"

Leningrad, Zhurnal Organicheskoy Khimii, Vol 6, No 9, Sep 70, pp 1815-1820

Abstract: Condensation of tetrafluorophthalic anhydride with ethyl acetoacetate in acetic anhydride and triethylamine gives a 61% yield of triethylamine salt of 2-carboethoxy-4,5,6,7-tetrafluoroindandione-1,3 (I) which upon acidification yields the free (I), m.p. 130-132°. According to IR, PMR, and NMR-F¹⁹ spectra this compound exists entirely in enolic form. Heating (I) in acid medium yields 4,5,6,7-tetrafluoroindandione-1,3 (II), m.p. 182-184, which exists entirely in the diketo form both in solid state and in CCl₄ or CHCl₃ solutions. In alcohol and alcoholic base the tautomerism shifts towards the enolic form. Methylation of (II) by diazomethane in ether yields the methyl ether of the enolic form of (II), m.p. 118-119°. Under such conditions indandione-1,3 does not methylate. Oxidation of (II) by SeO₂ in benzene gave bis-4,5,6,7-tetrafluoroindandione-1,3, m.p. 320-323°. Nitration of (II) by a mixture of nitric acid and acetic acid gave 2-nitro-4,5,6,7-tetrafluoroindandione-1,3 (III), m.p. 143-144°. Bromination of (III) gave 2-bromo-2-

"Synthesis and Transformation of Polyfluorinated Indandiones-1,3. I"

Leningrad, Zhurnal Organicheskoy Khimii, Vol 6, No 8, Aug 70, pp 1636-1644

Abstract: The purpose of this work was to synthesize polyfluorinated cyclic β -ketones -- indandiones-1,3. It was found that both phthalic and nitrophthalic anhydrides react with phenylacetic acid in the presence of triethylamine in a solution of acetic anhydride to give high yields of the corresponding indandiones-1,3. Condensation of pentafluorophenylacetic acid with phthalic anhydride and with its fluorinated analog produces polyfluorophthalides which may be regrouped to give the desired polyfluorinated indandiones-1,3. The structure of the resultant substituted phthalides was confirmed by infrared and ultraviolet spectroscopy.

"Model Sound Waves in a Wedge with the Aid of Moire Patterns"

Moscow, Akusticheskiy Zhurnal, Vol 16, No 1, 1970, pp 10-14

Abstract: Analogy modeling of the sound field in a wedge is examined with the aid of moire patterns formed by superimposing moire gratings. It is shown that moire patterns make it possible to graphically represent the vertical distribution of the field at different distances from the rib of the wedge. The question of the number of normal waves in the plane-parallel layer and the wedge which must be modeling in estimating losses accompanying the reflection of sound from the absorbing bottom was investigated.

The angle between the normal to the fronts of each of these waves and the boundary of the flat layer for the case of identical (soft or hard) absolutely reflecting boundaries is

$$\delta_n = \text{arch} \sin \left(\frac{n\lambda}{2H} \right) \quad (1)$$

USSR

BARKHATOV, A. N., et al., Akusticheskiy Zhurnal, Vol 16, No 1, 1970, pp 10-14

where n = number of normal wave, λ = length of sound wave, and H = thickness of layer.

On the other hand, the period of the moire pattern H_M formed by superimposing two hatched gratings with the same period λ_M is determined by the formula:

$$H_M = \frac{\lambda_M}{2 \sin \varphi_M} \quad (2)$$

where $2\varphi_M$ = angle of intersection of grating hatchings.

"Automatic Control System for Chlorination of Titanium Slags Based on
'Center' Pneumatic Complex"

Moscow, Tsvetnyye Metally, No 7, Jul 73, pp 54-57.

Abstract: An automatic control system has been developed, based on the "Center" pneumatic complex. The specific features of the connections between sections, arrangement of components, hierarchical structure for assembly and processing of information and control structure are described. Information is output from the system only if the operator needs to interfere or if a disruption of the proper mode occurs. This eliminates the need for the operator to process "excess" information direct from the sensors when the apparatus is operating normally. This control complex, put on stream at the Ust'-Kamenogorsk Titanium-Magnesium Combine, is an intermediate stage on the path to total automation of the combine under electronic computer control. The pneumatic control system was selected partially because the older, non-automated control system was pneumatic.

"The Effect of Chlorocholine Chloride on the Quality of Winter-crop Wheat Seeds"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol. 11, No 10 (120), 1973, pp 60-61

Abstract: It has been shown that application of tur in the optimal dose of 4 kg/hectare improved the planting quality of the seeds of winter-crop wheat. This was especially effective in case of the strains subject to tumbling. Treating the plants with chlorocholine chloride lowered the mass of seeds of the new crop, but their energy of germination and vitreousness was increased.

"Ultrastructure of the Pancreas After Hypoxic Hypoxia"

Leningrad, Arkhiv Anatomii Gistologii i Embriologii, Vol 60, No 4, Apr 71,
pp 28-32

Abstract: Hypoxic hypoxia was induced in 27 male Wistar rats in an altitude chamber where they were kept of 5 hours at an atmospheric pressure of 307 mm Hg. Significant changes were observed in the parenchymal cells and in blood capillaries of the pancreas. Immediately after the animals were removed from the altitude chamber, the perinuclear space and nuclear pores of acinar cells were markedly enlarged; their mitochondria were swollen and had single cristae. The granular endoplasmic reticulum acquired the form of round bacuoles with invaginations, while the Golgi complex was markedly reduced. In blood capillaries, the basal layer was thin, the endothelial cells were flattened, and their nuclei had blade-like processes with uneven outlines. Six hours to 3 days after exposure to hypoxia, the granular endoplasmic reticulum assumed the form of elongated, dilated cysts with a large number of ribosomes. The cyto-

plasm of both the parenchymal and the endothelial cells contained numerous scattered ribosomes and polysomes; the mitochondria were small and had many cristae, while the matrix took up a large amount of osmic acid. The cytoplasm of acinar cells contained many zymogen granules as well as their precursors and clear granules. Thus, ultramicroscopic changes observed immediately after exposure to hypoxia were indicative of pancreatic hypofunction with disturbed protein metabolism, while changes which developed 6 hours later and persisted for 3 days suggested pancreatic hyperfunction.

FEATURES TO PECULIAR GLOBAL CESIUM-137
AND STRONTIUM-90 REACHING THE POPULATION
OF POLECIA BY DIFFERENT FOOD SUPPLY ROUTES

A. N. Marey, R. M. Barkhudarov, V. K. Chumak, E. V. Petukhova,
E. B. Tyurukanova, G. A. Kuznetsova, N. Ya. Novikova,
S. P. Pozhilova, G. A. Bogdanovich

The paper presents investigation data on the order of passage of abovementioned isotopes from the soil into food products with due regard for the soil nature and the accumulation of isotopes in the human body. The finding was that the extent of the passage of cesium-137 from the soil into food products fluctuated considerably and depended on the type of soil. Thus, in a soil consisting mainly of a sand fraction the passage of cesium-137 was more pronounced. Similar observation were made in respect to all of the objects examined. However, no differences in the migration of strontium-90 could be detected. Due to the high passage of cesium-137 into food products its content in the human body was high as well.

"Glycogen Concentration Changes in the Heart Muscle of Irradiated Rats"

V sb. Materialy 3 Zakavkaz. nauch. konf. patofiziologov, 1972 (Collection of Papers Presented at Third Transcaucasian Scientific Conference of Pathophysologists, 1972), Tbilisi, 1972, pp 151-152 (from Referativnyy Zhurnal -- Biologicheskaya Khimiya, Otdel'nyy Vypusk, No 2, 1973, Abstract No 2F1335 by V. M. Podval'naya)

Translation: Comparatively small doses of ionizing radiation cause a stress reaction, along with its specific effect. When radiation sickness is very light or light, the glycogen concentration in the heart muscle is the protective reaction of the animal organism and constitutes a part of the general adaptation syndrome. Adrenergic structures in the hypothalamus-hypophysis-adrenal cortex system represent the necessary link without which the activation of this system is impossible.

"Effect of a Permanent Magnetic Field on the Rat Myocardium Content of Na, K, Ca, and Glycogen in the Process of Acclimatization to the High Mountain Conditions of Aragats"

Yerevan, Biologicheskiy Zhurnal Armenii, Vol 24, No 2, Feb 71, pp 95-97

Translation: Considerable importance has been attached during the past few years to investigation of the effects of a magnetic field on the human and animal organisms. This is explained first by the fact that the intensity of magnetic fields utilized in industry and scientific research has been considerably magnified, and second -- by the fact that a connection has been established between the increase in the frequency of sudden deaths caused by cardiovascular failure and the formation of solar magnetic storms. At present the intensity of the permanent and temporary fields in free play attains a magnitude of 100,000 oersted, while impulsive magnetic structures can create a magnetic field with an intensity of up to 2,500,000 oersted.

Data obtained in investigations of the effect of a permanent magnetic field on the electrolyte (Na, K, Ca) and glycogen and content in the myocardium

1/6

USSR

MOVSESYAN, M. A., et al., Biologicheskiy Zhurnal Armenii, Vol 24, No 2,
Feb 71, pp 95-97

of rats during the process of acclimatization to high altitude conditions are cited in this report.

The investigations were carried out on 166 white nonbred rats 150-200 grams in weight transferred from Yerevan (900 meters above sea level) to Mount Aragats (3,250 meters above sea level).

At different periods of their habitation on the high mountain (24, hours, 7 and 40 days) a part of the rats were placed in a magnetic field with a magnitude of 7,800 oersted where they were kept for two hours. Together with the controls (rats not placed in the magnetic field) they were then sacrificed for the purpose of determining the myocardium content of the indexes mentioned. The electrolyte content was determined with the help of a DPF-58 type of flame photometer and expressed in milliequivalents per liter; the glycogen content was determined by the Mendel-Khuglas method.

The same indexes were studied in intact rats under Yerevan conditions. A comparison of the data obtained in the investigation of the intact rats under Yerevan conditions with the data obtained at different periods of habitation of the rats at the high altitude enabled us to arrive at a representation of the changes which take place in the myocardium content of Na, K, Ca, and

2/6

- 39 -

USSR

MOVSESYAN, M. A., et al., Biologicheskiy Zhurnal Armenii, Vol 24, No 2,
Feb 71, pp 95-97

glycogen during the process of acclimatization. At the same time the data obtained in the study of these two groups served as a control for study of the influence of the magnetic field.

The results of the above-described investigations are presented in the table.

It is obvious from the data obtained that during the process of acclimatization changes in the rat myocardium content of Na, K, Ca, and glycogen take place.

In the course of the 40-day habitation of the rats on Mount Aragats the myocardium content of glycogen gradually diminished, with the largest diminution noted on the seventh day. In the same animals the myocardium content of Ca gradually and only slightly increased, while changes in the quantity of Na and K were wave-like in character; the heart tissue's content of Na and K increased within 24 hours, decreased by the seventh day, and again increased by the 40th day.

It was found that placing the animals in a magnetic field for two hours affects the course of the indicated changes, particularly if the rats are placed in the magnetic field on the first day of their transfer from Yerevan to Mount Aragatz. For instance, it was noted that when rats 22 hours after

3/6

USSR

MOVSESYAN, M. A., et al., Biologicheskiy Zhurnal Armenii, Vol 24, No 2,
Feb 71, pp 95-97

their arrival on Mount Aragats were placed and kept for a period of 2 hours in a magnetic field and then sacrificed to determine the myocardium content of Na, K, Ca, and glycogen, the results obtained differed from the results obtained in investigation of the intact animals.

Differing from the intact animals, no wave-like changes in the content of Na, K, and Ca occur in the experimental rats. Under the influence of the magnetic field the heart muscle's content of Na and K is considerably diminished. In the same animals the effect of the magnetic field tends to induce a still greater decrease of the myocardium content of glycogen. When the rats, however, were placed in the magnetic field on the 7th and 40th days on Mount Aragats no particular changes were noted.

Thus the animals were found to be most sensitive to the influence of a magnetic field when they had not become adapted to high altitude conditions. As adaptation progresses the sensitivity of the organism to the influence of the magnetic field decreases.

"A Case of Acute Chlorophos Poisoning With A Fatal Outcome"

Moscow, Terapevticheskly Arkhiv, No 4, 1971, pp 118-119

Abstract: A 42-year-old man was brought unconscious to the hospital where he died within six hours despite heroic treatment for suspected poisoning by an unknown agent. The clinical course of the intoxication was similar to that described in the literature, except for the absence of convulsions. The diagnosis was established at autopsy, when chemical analysis of tissues revealed the presence of phosphorus and a chlorine-containing substance thought to be the organophosphorus compound chlorophos. It was subsequently learned that chlorophos had recently been used in the dead man's home as an insecticide.

"Utilization of Polymer Materials and the Progress in Agriculture"

Moscow, Plasticheskiye Massy, No 11, 1973, pp 3-6

Abstract: The authors analyze the developments in polymer materials and their application to various agricultural problems. The most widely used application is that of the plastic films, which in many cases was found to replace effectively glass. The second important development was in the area of plastic pipes, construction materials and even in machinery parts. The remainder of this paper is aimed at the needs for future developments, which principally revolved around greater range of applicability, by aiming at more precisely designed products adaptable to the conditions prevailing in the area of utilization.

"A Device for Packing Radio Components in Thermoplastic Film"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 32, 1970, Soviet Patent No 284074, Class 21, 81, filed 23 Jun 69, p 32

Abstract: This Author's Certificate introduces a device for packing radio components in thermoplastic film. The device contains two bobbins for the film sheets, reverbaratory furnaces, tappets with spring-return rods, a tape-transport mechanism and a holder with a chute. As a distinguishing feature of the patent, the expenditure of packing film is reduced by fitting the device with a guide element, parallel to which are cover plates with rectangular openings, while the tape-transport mechanism is equipped with nippers. On one of the sections of these nippers are heaters made in the form of wires stretched in two mutually perpendicular directions between spring-braced stands.

"The Effects of Neuroleptic Drugs on Aggressive Behavior"

Moscow, Zhurnal Nevropatologii i Psichiatrii, Vol 72, Vyp 1, pp 108-111

Abstract: Four neuroleptic drugs were tested on mice and rats in whom aggressive behavior was induced by Tedeschi's method and on cats and monkeys with a naturally aggressive disposition. Aminazine and ethaperazine exerted a strong tranquilizing effect. However, a threat still provoked an aggressive response, despite the otherwise apathetic and semidormant condition of the animals. Karbidin and triflazin, in appropriate doses, caused no psychomotor depression but completely eliminated aggressive behavior, which was most evident on monkeys. The findings correlate well with clinical observations made on patients treated with these drugs.

"Neurotropic Properties of Fluzophenazine"

Moscow, Farmakologiya i Toksikologiya, Vol 34, No 3, May-Jun 71, pp 287-290

Abstract: Neurotropic properties of fluzophenazine -- 10-(γ -[4-(β -hydroxyethyl)-pipersinyl-1]-propyl}-2-trifluoromethylphenothiazine dihydrochloride were investigated. The drug was found to be a highly potent neuroleptic. It produced catalepsy, inhibited conditioned reflexes of avoidance, spontaneous motor activity, averted phenamine-induced hyperactivity, prolonged and potentiated the anesthetizing effect of sodium thiopental and hexobarbital, synchronized EEG, and blocked EEG-activation provoked by an acoustic stimulant and phenamine. Fluphenazine is an extremely potent antiemetic. Compared with triflazin, fluphenazine is less toxic and exceeds trifluoperazine in neurotropic activity.

PHILOSOPHICAL ISSUES IN PHARMACOLOGY

[Article by V. M. ZAKOV, N. N. ZAKOV, Yu. S. BURG (Moscow); Moscow, Vestnik Akademii Meditsinskikh Nauk SSSR, Russian, No. 3, 1977, pp. 76-82]

In modern times, the only effective methodology of science is materialistic dialectics, since dialectical materialism discloses the overall patterns of the world, their patterns also extend over medical sciences.

Specific, special laws are a manifestation of generalities under concrete conditions, and generality, in turn, is manifested via specific patterns. The basis of dialectical materialism on the universal relationship between phenomena must necessarily be taken into consideration when analyzing medical problems. Of course, when considering specific phenomena, one has to artificially separate them from certain lines, but ultimately, an overall, general analysis is required to avoid mutual judgments. For example, in the course of pharmacological investigation of new chemical compounds, the researcher obtains information about their different types of activity. Each type of activity, naturally, would permit different (and often contradictory) inferences in relation to other properties. Determination of the specificity in the course of the preparation, however, the set of data obtained permits more precise investigation of the nature of action. At a minimum and identification comes in helping to a specific group of pharmacological agents. V. I. Lenin indicated that as he moves up from the concrete to the abstract, one invades ever denser strata from reality (if the abstract is correct), he comes closer to it, since all serious abstractions reflect nature more deeply.

A fact is the reflection of some aspect of a subject (object), or phenomenon in man's consciousness. This means that the fact has a subjective component too, and that one should avoid a simple pursuit of the "logic of facts." In my opinion, investigators evaluate differently the same fact (for example, the same investigative method or set of properties of a drug). Dialectical materialism, however, is the method that allows the investigator to be properly oriented in different, even contradictory, facts, and to find the connection between them.

The principle of complementarity introduced by Bohr is very important in dialectic philosophy of basically two phenomena; i.e., the one of naturally

"Psychopharmacological Substances"

Moscow, Zhurnal Vsesoyuznogo Khimicheskogo Obschestva imeni D. I.
Mendeleyeva, Vol 15, No 2, 1970, pp 156-164

Abstract: WHO recommends that the group of psychopharmacological substances include only those products which effect the psychic functions and the experience of life. The group includes innumerable neuropsychiatric drugs. Neuroleptics, acting on the autonomic nervous system, defuse the autonomic functions in schizophrenia and maniacal states by disturbing the extrapyramidal system, they may induce lack of muscular coordination. Derivatives of phenothiazine, thioxanthene, reserpine and benzoquinoline are representative of this group. Tranquilizers, the anti-anxiety drugs, include anticonvulsants, barbiturates, meprofan, some phenothiazines, and hundreds of allied products. Antidepressants, used in manic-depressive reactions include hydrazine and some inhibitors.

"Complex Compounds of Titanium-IV and Vanadium-III with Diethylene-
triaminepentaacetic Acid"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 44, No 7, Jul 70, pp 1609-
1613

Abstract: Formation of complexes of Ti^{4+} and V^{3+} with diethylene-
triaminepentaacetic acid (H_5P) in aqueous solutions was studied
by the spectrophotometric method. Only complexes with a 1:1
molar ratio of the two components (metal ion and H_5P) were formed.
The following complexes formed in the pH ranges indicated: $TiHP^-$
(pH 1.3-1.7), TiP^{2-} (pH 1.7-2.0), VP^{2-} (pH 0.4-0.9). The negative
logarithms of the acidolysis and dissociation constants of the
three complexes were calculated.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ESTROGENIC ACTIVITY OF SOME ESTRADIOL DERIVATIVES POSSESSING ELECTROPHILIC SUBSTITUENTS IN THE RING A, ESTRENOLICS WITH THE DOUBLE BOND IN DIFFERENT POSITIONS, ESTRADIOL ESTERS AND 15,16,DEHYDROESTRONE HAS BEEN STUDIED ACCORDING ALLEN DOISY METHOD. IT HAS BEEN SHOWN THAT IN SOME CASES EVEN INSIGNIFICANT CHANGES IN THE MOLECULE OF A NATURAL ESTROGEN (FOR INSTANCE FLATTENING OF THE D RING OR THE CHANGE OF THE HYDROXYL POSITION IN THE RING A) CAUSES A DECREASE OF ESTROGENIC ACTIVITY. ONLY A STRICTLY DEFINITE DISTRIBUTION OF ELECTRON DENSITIES IN THE HORMONE MOLECULE AS WELL AS ITS CONFORMATIONAL PROPERTIES GUARANTEES HIGH AFFINITY TOWARDS THE RECEPTOR. INTRODUCTION OF SUBSTITUENTS INTO THE 2 AND THE 4 POSITION CAUSES A COMPLETE LOSS OF ESTROGENIC ACTIVITY OF THE MODIFIED MOLECULE DUE TO A STERIC HINDRANCE OR OWING TO A POSSIBLE FORMATION OF INTRAMOLECULAR HYDROGEN BONDS WITH THE PHENOL HYDROXY GROUP.

DISTRIBUTION OF MONOMYCIN IN ORGANS AND TISSUES OF LABORATORY ANIMALS AFTER ITS ADMINISTRATION BY VARIOUS ROUTES

Neuymin, N.I.; Barkov, V.N.

E. I. Martsinovsky Institute for Medical Parasitology and Tropical Medicine, Moscow

The dynamics of monomycin distribution in the skin and organs of animals on parenteral administration and local application of the antibiotic was studied. The highest levels of monomycin on its local application to the skin in a dose of 10 000 Units/kg were observed in the blood and the skin in 1-3 and 3-8 hours respectively. When monomycin ointment was applied to a restricted skin area of animals not fixed in cages in a single dose of 2 g/kg, the highest concentration of the antibiotic was recorded in 24 hours at the site of application. On application of the ointment in the same dosage to fixed animals the monomycin skin levels were twice as higher. After repeated applications no significant accumulation of the ointment in the skin and the organs was observed. On local application to the skin the maximum levels of monomycin in the internal organs were lower than those after parenteral administration which may be of use in prophylaxis of complications.

"Reprocessing waste titanium and its Alloys in a Chloride Melt"

Moscow, Metallurgiya i Khimiya Titana (Institut Titana), Metallurgiya Publishing House, Vol 6, 1970, pp 135-140

Translation: Results are given of experimental-industrial research on the reprocessing of ungraded waste mixtures of chips from different titanium alloys by chlorinating in a chloride melt. An experimental batch of marketable titanium sponge was obtained. The characteristics of the raw material used, the chlorine gas, the coke, and the working fusion are given, along with a description of the technological conditions, the chart for preparing chips for chlorination, and the technological equipment charts for the chlorination and cleaning conversions. An analysis is made of the distribution of alloying elements in the products of chlorination. Basic expenditure coefficients, calculated per ton of industrial titanium tetrachloride, are deduced, and data are given on the quality of the TiCl₄ and the sponge titanium obtained. Three illustrations and one table.

V. sb. Materialy Nauchn. konferentsii, posvyashch. 50-letiyu In-ta med. parazitol. i trop. med. (Proceedings of the Scientific Conference Commemorating the 50th Anniversary of the Institute of Medical Parasitology and Tropical Medicine -- collection of works), Moscow, 1970, pp 61-63 (from RZh-36. Meditsinskaya Geografiya, No 1, Jan 71, Abstract No 1.36.124)

Translation: A total of 31 cases of histoplasmosis were recorded in the USSR by the beginning of 1970. Of these, 24 were in Western Siberia. A total of 690 soil specimens were examined, gathered from sites where histoplasmosis was recorded (Tyumenskaya oblast, Turkmen SSR and others) and from sites having no cases (Armenian SSR and the environs of Moscow). The agent of histoplasmosis was isolated from soil of the Turkmen SSR. In one out of 50 house mice (in Turkmen SSR) signs were found of histoplasmosis. Skin tests (176 in Tyumen oblast and 591 in Turkmenia) were made yielding positive results in 2% and 5.6% of the cases studied, respectively.

SPODUMENE ALTEVATION UNDER THE ACTION
OF Li HYDROPIDE SOLUTIONS

Spodumene alteration is observed in 5N and 1.67N solution of lithium hydroxide at 100°C. The process is characterised by large uptake of lithium from the solution by mineral. 18 hours contact of spodumene with a 5N lithium hydroxide solution results in the formation of a single phase product consisting of lithium hydroalumosilicate having the composition $3.6\text{Li}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 3.9\text{SiO}_2 \cdot 2.4\text{H}_2\text{O}$. In 1.67N solution the crystallisation of the same hydroalumosilicate takes place, but there is a small admixture of lithium hydroalumosilicate of the composition $\text{Li}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot n\text{H}_2\text{O}$.

"Existence and Uniqueness of Solutions of Differential-Functional Equations
in Banach Space"

Mat. fizika. Resp. mezhved. sb. (Mathematical Physics. Republic Interdepartmental Collection), 1970, vyp. 8, pp 30-35 (from RZh-Matematika, No 5, May 71, Abstract No 5B951)

Translation: The author considers the problem $\frac{dx(t)}{dt} = [\Phi(x)](t)$, $x(t_0) = x_0$. Here Φ is the mapping of $E(t_0, \infty)$ in $E(t_0, \infty)$, where $E(t_0, \infty)$ is a space of vector functions continuous on $[t_0, \infty)$ with a domain belonging to a complex Banach space; i. e., Φ , generally speaking, is a nonlinear operator. The expression $[\Phi(x)](t)$ is understood to mean the value of the vector function $\Phi(x)$ at point t . The existence and uniqueness of the solution of the problem under the condition

>

$$|[\Phi(x)](t) - [\Phi(y)](t)| \leq q(t) \max_{t_0 < t < t_0 + \epsilon} |x(\tau) - y(\tau)|$$

is proved, where $q(t)$ does not depend on x, y and is a locally summable function when $t > t_0$. Examples are cited of operators which satisfy the given condition. Author's abstract.

CIRC ACCESSION NO--AP0125689
ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE USE OF 8 MERCAPTOQUINOLINE (I)
IN THE EXTN. AND PHOTOMETRIC ANAL. OF 2, AND 3, COMPONENT FERROMAGNETIC
FILMS (FE,CO,NI, FE,NI, FE,CO, AND CO,NI) WAS STUDIED BY USING SYNTHETIC
SAMPLES. I CAN BE USED SUCCESSFULLY IN THE ANAL. OF FERROMAGNETIC
MATERIALS. THE SAMPLE OF THE FERROMAGNETIC MATERIAL IS DISSOLVED IN H
SUB2 SO SUB4 OR HCL, TREATED WITH AQ. SOLN. OF 1, NH SUB4 OH, AND CHCL
SUB3. THE CHCL SUB3 EXT. IS TREATED WITH AQ. 6-8N H SUB2 SO SUB4 TO
REMOVE FE, THEN WITH AQ. HCL TO REMOVE NI. THE AQ. SOLNS. ARE REEXTD.
WITH CHCL SUB3. THE ABSORBANCES OF THE CHCL SUB3 EXTS. OF FE, CO, AND
NI 8 MERCAPTOQUINOLINATES ARE MEASURED AT 450, 470, AND 540 NM, RESP.
FACILITY: INST. FIZ. TVRD. TELA PULUPROV., MINSK, USSR.

"Method for Experimental Determination of the Electrotechnical Factors of the Switching Effect on the Rectifiers of a Converter with an Investigation of the Electromagnetic Processes"

Nauch. tr. Omsk. in-t inzh. zh.-d. transp. (Scientific Works of the Omsk Institute of Railroad Transportation Engineers), 1970, 117, pp. 11-21 (from RZh-Elektronika i yeye primeneniya, No. 5, May 1971, Abstract No 5B421)

Translation: The paper discussed a method for determining the electrotechnical factors of the switching effect on the rectifiers of a converter with an investigation of the electromagnetic processes.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. CONSIDERATION OF POLAR TENSOR IN THE HIGHER RANK BY ANALYSIS OF INDIVIDUAL COMPONENTS BECOMES TOO CUMBERSOME, AS FOR EXAMPLE IN CRYSTALS WITH 32 SYMMETRY CLASSES. THE APPLICATION OF MATRICES ALSO HAS DRAWBACKS, AND THE PROPOSED METHOD IS BASED ON PRESENTATION OF TENSORS OF RANK ABOVE THE SECOND ORDER BY A COMBINATION OF PRODUCTS. THESE INCLUDE TENSOR OF THE SECOND RANK UNIT VECTORS ORIENTED ALONG THE CRYSTAL SYMMETRY ELEMENTS. THE SECOND RANK TENSORS ARE DERIVED FROM THE CONDITION OF INVARIANCE OF TENSOR AS FAR AS THE SYMMETRY GROUP TRANSFORMATIONS. THE PROCEDURE CAN BE EXTENDED TO HIGHER RANK TENSORS.

104571q Solubility products of 8-mercaptopquinolines of certain metals. Kharkover, M. Z.; Barkovskii, V. F.; Vdovina, V. M.; Gurova, I. P. (Ural State University, USSR). Zh. Anal. Khim. 1970, 25(1), 30-3 (Russ). Soly. products of Co, Pb, Zn, V, Bi, and Mn 8-mercaptopquinolines were detd. by an extn.-photometric method. Their neg. logs are 29.00, 26.02, 29.44, 25.10, 46.81, and 15.94, resp. Soly. products of Fe, Mn, Ni, and Bi thiooximates in CHCl₃ were detd. The following soly. scale was composed: Mn > V > Pb > Ni ~ Fe > Co ~ Zn > Bi. Conditions for sepg. those elements with thiophene were calcd.
