"Structure and Phase Composition of the Calorized Layer"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No. 2, 1971,  
pp 7-11

**Abstract:** The structure and phase composition of the layer formed by thermodiffusion calorizing of specimens heated in a furnace at rates of 0.1 and 10°/sec, and also electrically heated at 50 and 1000°/sec are studied. Results are presented from metallographic studies, X-ray phase and microroentgenospectral local analyses, and measurement of microhardness and thermal EMF of the layer. The dependence is established between the data produced by the various methods. The curve of the change in thermal EMF allows the concentration of aluminum in the layer and its phases to be determined. The influence of electric heating on the structure and phase composition of the calorized layer is demonstrated. Studies are performed for base specimens of Armco iron (0.05% C) and KhSM steel (0.1% C); 4.42% Cr; 0.05% Mo). When calorizing was performed in a furnace from a vapor-gas phase with heating rates of 0.1 and 10°/sec at 950-1200°C with

holding from 1 minute to 8 hours, the layer formed consisted of two zones, an outer, brittle layer consisting of an ordered solid solution of FeAl, containing 18-33% Al, plus a thicker solid solution of aluminum at the base, going over to a superstructure of  $Fe_3Al$  when the aluminum content reaches 10%. Electric heating prevents formation of the outer brittle zone. The entire layer consists of a solid solution of aluminum in iron, with aluminum concentration only 18-20% at the surface.

"The Effect of Fast Heating on the Formation of the Transition Zone in Bi-metals of the Iron-Titanium System"

Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy -- Chernaya Metallurgiya,  
No 11, 1970, pp 130-133

**Abstract:** An investigation was made of the kinetics of the formation of the transition zone in the bimetals Armco iron-VT1-0 and steel 20-VT1-0 in repeated heating with rates of  $v = 4$  deg/sec (furnace heating) and  $v = 100$  deg/sec (electroheating), in a 940-1070°C interval, and with aging for 0-150 min ( $v = 4$  deg/sec) and 0-4 min ( $v = 100$  deg/sec). The deformation process of the diffusion transition zone in the bimetals intensifies in fast heating with  $v = 100$  deg/sec. The diffusion of titanium in iron in fast heating takes place primarily in the grain boundaries. Microhardness and micro-thermoelectric power methods and X-ray phase analysis and metallographic analysis showed that an increased heating rate from 4 to 100 deg/sec in repeated heating after rolling does not affect the phase composition and structure of the transition zone in the bimetals.

"Gas Titanium Plating of Iron in High-Speed Electric Heating"

Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy, Chernaya Metallurgiya, No 5, 1970,  
pp 123-126.

**Abstract:** A report is presented on the development and investigation of a process for titanium plating of iron from a hydrogen-free vapor-gas phase using high-speed electric heating. Titanium tetrachloride vapors were used as the active medium and were introduced into the reactor by a flow of purified argon. The latter served as a TiCl<sub>4</sub> vapor carrier and diluent. The process was studied in the 950-1400°C temperature range with holding time from 1-9 minutes and heating rates of 1, 100, and 1000 degrees per second on commercial iron (about 0.07% carbon). The kinetics of the gas titanium plating process and the structure and nature of the phases formed in gas titanium plating under high-speed electric heating conditions were studied by microscopic analysis methods and measurement of microhardness and microthermoelectromotive forces. Acceleration of heating intensifies the gas titanium plating process, and diffusion layers are obtained only

under fast electric heating conditions (100-1000 degrees per second) at temperatures of 1100°C and higher. Thickness of the layers formed ranges between 20 and 80 microns, depending on saturation conditions. The layers formed represent a solid solution of titanium in Alpha-iron. In some cases, especially in increase of titanium tetrachloride content in the gas mixture of 25%, the formation of two-phase layers was observed.

"The Influence of Grain Size on Short-Time High-Temperature Strength of Steels and Alloys"

Moscow, Metallovedeniye i termicheskaya obrabotka metallov, No 3, 1970, pp 6-7

Abstract: The possibility of using the fine-grained structure of heat-resistant steels and alloys under service conditions at high temperature for short periods of time (from minutes up to 1 hour) was investigated. Experiments on short-time heat resistance were conducted on the IP-4 experimental setup in accordance with a method described earlier. The same setup was used for tests on prolonged heat resistance (more than 10 hr) in accordance with a standard method (GOST 10145-62). The Kh12N20T3R and Kh25N16G7AR steels and KhN77TYu nickel alloy were tested. The results confirmed the assumption that the fine-grained structures of heat-resistant steels and alloys are stronger than the coarse-grained structure, within the range of relatively high temperatures considered. 3 figures, 6 references.

I-8. STATISTICS OF THE INITIAL STAGE OF THE FORMATION OF THE CRYSTALLIZATION CENTERS

[Article by D. N. Alekseev, B. I. Kudryavtsev, Novosibirsk; Revolutions, III Symposium po Protsessam Rosta i Smery Poluprovodnikovym Kristallom. Press. Russkaya, 12-17 June, 1972, p. 10]

In thermodynamic and fluctuation theory, the formation of the crystallization centers is considered as a random process. Therefore, the complete quantitative description of the crystallization laws requires knowledge of the corresponding statistical-probability characteristics reflecting the effect of the external factors and the characteristic features of nucleation. The further development of the mathematical theory of the nucleus formation process as a random process has been carried out. Considering the basic principles of the thermodynamic theory of stochastic processes, the theory of procedural statistics and the laws of homogeneous and heterogeneous nucleation of the solid phase in super-cooled melts and supersaturated solutions.

A probability theory analysis is performed of the type of distribution function of the sojourn time for the appearance of the first crystallization center in the procedure of experimental research with one and many samples, in the case of variable and constant supersaturation. In the presence of heterogeneity in the melt, nonstationarity and the nonisothermal nature of the process, the effect of the mechanism of nucleus formation on the type of distribution function and also the dependence of the kinetic parameters of the process defined from the distribution function of the induction periods of crystallization on the external conditions are discussed. The investigated mathematical models are compared with the experimental data with respect to nucleus formation statistics and rotations and melts of different substances.

V-11. GROWTH OF ZINC OXIDE CRYSTALS IN THE  $ZnO$  solid- $H_2-O_2-H_2$  and  $ZnO$  solid- $H_2-N_2-D_2$  SYSTEMS

[Article by T. D. Levitskaya, P. G. Pan'ko, B. I. Kidyarov, Novosibirsk; Sov. Tekhnichesk. Tsv. Sistem. po Vsesoyuzn. Resenii, 1971, Poluprovodnikovye Materialy i Prib., No. 1 (June, 1972), p. 62.]

A thermodynamic analysis was performed on the  $ZnO$  solid- $H_2-O_2-H_2$  system, and an experimental study was made of the crystallization process in this system.

The hydrogen flow diluted with nitrogen passes over dispersed zinc oxide, reducing it and transporting it into the crystallization zone to which the mixture of oxygen and nitrogen is fed. The quantity, size and perfection of the zinc oxide crystals depend on the process temperature and the oxygen and hydrogen concentrations.

The feeding of water vapor together with hydrogen into the reduction zone promotes a decrease in the number of fine, accicular crystals and growth of larger perfect crystals. With duration of the process of 30-70 hours, well faceted crystals of zincite were obtained which are elongated along the c axis 3-4 mm in diameter and 20-30 lombs.

The replacement of oxygen by water in the oxidation zone changes the crystallographic direction of the predominant crystal growth: the crystals have the shape of a three-sided prism extended along the a-axis and with dimensions of 3 x 3 x 30 mm.

In the general case where a flow of hydrogen, water and nitrogen passes over the sintered zinc oxide and oxygen, water, nitrogen are fed into the crystallization zone, the form of crystal growth is determined by the ratio of the component concentrations in both flows.

The process temperature of crystallization of quite perfect crystals is reduced to 1200°C by comparison with 1300°C-1400°C used in similar processes.

XI-1. STUDY OF THE CRYSTALLIZATION LAWS OF SEMICONDUCTOR SUBSTANCES

[Article by B. I. Kidyarov, P. L. Mintskev, I. I. Aleksandrov. Sverdlovsk: Novosibirsk, [USSR] Steklov Institute of Mathematics, Siberian Division, Krasnoyarsk, 12-17 June 1977, p 144]

A statistical study was made of the initial stage of crystallization of semiconductors—tin, lithium and tellurium—taken from the melt and also lithium iodate from an aqueous solution. It was demonstrated that there is a discrete series of temperatures and concentrations for which the beginning of crystallization of the supercooled melts and the supercooled solutions is most probable. The height of the peaks of the nucleation rate of the crystallization centers decreases with an increase in supersaturation and duration of holding in the supercooled state, and their position does not depend on the preliminary treatment of the melt. The existence of such a discrete series of temperatures is detected at the present time for such a diverse series which multiplies different variation of the chemical bond type: semiconductor-conductor (Si), semiconductor-metal (Ge, In, Sn), semiconductor-metal (LiClO<sub>4</sub>), metal-metal (Nb, Sn), dielectric-metal (LiNO<sub>3</sub>).

The waiting time distribution function for the appearance of the first crystallization center (1) at the peak of the nucleation rate is subjected to the exponential law of the nonuniform batch (1) and at the minimum it has a more general form connected with the presence of prolonged nonstationary crystallization periods (2):

$$(1) f_{\tau} \propto e^{-\tau/\tau_0} \cdot \left( \frac{\tau}{\tau_0} \right)^{n-1} \cdot \exp\left(-\frac{\tau}{\tau_0}\right)$$

(2)  $f_{\tau} \propto \frac{n_0}{\tau_0^2} \cdot \left( \frac{\tau}{\tau_0} \right)^{n-1} \cdot \exp\left(-\frac{\tau}{\tau_0}\right) \cdot \tau^{n-1} \exp\left(-\frac{\tau}{\tau_0}\right)$ .

where  $n_0$  is the total number of samples for the number of tests on one sample.

The indicated relations (1) and (2) were also observed when studying the crystallization of tin salts, and they obviously have a general nature.

V sb. Nelineyn. protsessy v optike (Nonlinear Processes in Optics--collection  
of works), Vyp. 2, Novosibirsk, 1972, pp 399-407 (from RZh-Fizika, No 12,  
Dec 72, Abstract No 12D858)

Translation: A study is made of the dependence of the nonlinear characteristics of LiIO<sub>3</sub> on the frequency in order to discover new possibilities of applying this crystal for cascade laser emission frequency multipliers. The LiIO<sub>3</sub> crystals in the hexagonal version were grown from an aqueous solution containing 10% HIO<sub>3</sub> with respect to LiIO<sub>3</sub>. The nonlinear characteristics of the crystal were investigated by means of a glass Nd-laser with a broad generation spectrum of 0.008 Å. An experimental check was made of the intensity of the excited second harmonic as a function of the wavelength of the radiation propagated along the direction of synchrony. A study was also made of the dependence of the intensity of the second harmonic on the pumping beam deflection from the direction of synchrony. When determining the magnitude of  $d\theta_c/d\lambda$ , additional possibilities for a nonlinear frequency discriminator were discovered. The bibliography has 7 entries.

"Use Of Method Of Successive Approximations For Analysis Of Multisignal Operation Of A TWT (Abstract Of Deposited Manuscript)"

Elektron. tekhnika. Nauchno-tekh. sb. Elektron. SVCh (Electronic Technology. Scientific-Technical Collection. Microwave Electronics), 1970, Issue 12, p 49  
(from RZh-Elektronika i yeye primeneniye, No 4, April 1971, Abstract No 4A177)

Translation: Use of the method of successive approximations is considered for analysis of the processes in a traveling-wave tube during amplification of several signals with near frequencies. A comparison of the results of the first and second approximations is presented. The limits of applicability of simple analytical expressions obtained in a first approximation are evaluated. Particular attention is allotted to an investigation of crossmodulation phenomena. The behavior of the suppression function is analyzed as a function of the level of both signals and for various parameters of dissynchronism. It is shown that with an increase of the amplitude of the signal being suppressed, the effect of the suppression is decreased. The proposed method can be successfully utilized for detection of the high-frequency spectrum at the output of the TWT in the case of amplification of any number of signals with near frequencies. Summary.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE COM. CONTINUOUS WASHING OF RAYON STAPLE WITH OIL, NAOH SOLN. AT 78DEGREES REQUIRES 135 SEC TO REDUCE ITS S CONTENT BELOW 0.075PERCENT. THE INSERTION OF ROLLERS, WHICH COMPRESS THE STAPLE PERIODICALLY DURING ITS PASSAGE THROUGH THE BATH, AND TEMP. INCREASE TO 95DEGREES REDUCED THIS TIME TO 20-5 SEC. THE WASHING TIME WAS ALSO REDUCED TO 15-20 SEC WHEN VIBRATIONS OF 200 CYCLES-MIN AND 50 MM AMPLITUDE WERE APPLIED TO THE WASH SOLN. HELD AT 80DEGREES. BOTH OF THESE METHODS INCREASED PRODUCTIVITY. THE VIBRATIONS GAVE SOFTER, EASIER TO DRY FIBERS. FACILITY: INST. TEKH. TEPLOFIZ., KIEV, USSR.

"Semiconductor Low-Temperature Hygrometer"

Moscow, Kholodil'naya Tekhnika, No 7, 1971, pp 22-23

**Abstract:** The new GTA-70 automatic thermoelectric hygrometer developed by the Odessa Technological Institute of the Refrigeration Industry is described, and test results are presented. The new hygrometer permits determination of the dew point to  $-70^{\circ}\text{ C}$  at an ambient temperature of  $20\text{-}30^{\circ}$ . The operation of the optical system and other units of the hygrometer are described in detail. Operation of the instrument under laboratory and production conditions revealed that it requires a warm-up time of 1.5-2 hours for accumulation of cold in the intermediate tank with the water-alcohol solution. By leaving the auxiliary thermopile with an intake of no more than 100 volt-amperes on the warm-up time can be avoided. The reproducibility of the measurements is within the limits of  $1^{\circ}$ . At a dew point of  $-70^{\circ}\text{ C}$ , 20-30 measurements per hour can be obtained, and at a dew point of  $-40^{\circ}\text{ C}$ , 50-60 measurements per hour are possible.

STUDY OF SOME INDICES OF THE HIGHER NERVOUS ACTIVITY OF MEN SUBMITTED TO UNDERWATER ENVIRONMENT FOR MANY HOURS

*Original manuscript  
Article by S. O. Pulyar, V. N. Kiklevich, S. A. Fenyer, and I. S. Shchegoleva  
Donetsk State University, Kiev, Fiziolohichnyj Zhurnal Akademii Nauk  
Dnipro'kpol', Ukraine, Vol. 10, No. 5, 1972, pp. 77-80*

A long confinement of man to underwater laboratories or in open water with an air-tight pressure equaling that of the surrounding environment is one of the most prolonged methods for the study of oceans. An effective use of the underwater dwelling depends on the ability of aquanauts to perform scientific and technical tasks directly in the water for long time intervals.

Little is known about the mental activity of aquanauts in an underwater environment. In fact, only individual attempts were made to evaluate the activity of men at great ocean depths [1-3]. A positive correlation was established between a given rhythm on land and underwater breathing [4-6]. There are literature data indicating that the ability to perform physical work and that work output decreases with increasing water depth [1-7]. It was established during the Soviet I experiments that positive confirmation and work effectiveness deteriorate under water [7]. Lack of a uniform methodology [1] until the multifaceted approach to the problem, and environmental factors [8-10] make it impossible to establish the functional state of the higher nervous activity of aquanauts. Furthermore, a short underwater stay of aquanauts cannot be extrapolated for such longer time intervals.

The aim of this work was to study some indices of the higher nervous activity of aquanauts subjected to an underwater environment for many hours.

Experimental Methods

Two types of experiments were carried out, with 10 divers (A-2) 20 years old performing periodically a definite kind of physical work while under water for 2-6 hours and with aquanauts subjected to relative hypobarism for 26 (1 aquanaut) and for 38 hours (2 aquanauts). In order to dif-

Study of Geoactive Corpuscles and Photoelectrons

(Abstract: "Study of Geoactive Corpuscles and Photoelectrons on the 'Kosmos-261' Satellite," by A. D. Bolyunova, M. I. Bragin, Yu. I. Gal'perin, V. A. Gladyshev, N. V. Dzhordzhio, G. N. Zlozin, I. N. Kiknadze, R. A. Kovrashkin, T. M. Mulyarchik, Yu. N. Ponomarev, V. V. Temnyy, N. Fedorova, Yu. P. Shilyayev, F. K. Shuyskaya and R. V. Shulenina; Moscow, Kosmicheskiye Issledovaniya, Vol VIII, No 1, 1970, pp 104-136.)

The artificial earth satellite "Kosmos-261" was used in a study of low-energy geoactive corpuscles and fresh photoelectrons and their interaction with the earth's upper atmosphere. The satellite was launched on 10 December 1968. Orbital inclination to the equator was 71°, so that for a relatively long time it moved almost along a tangent along the auroral zone over the Soviet Far North, making it possible to increase the volume of simultaneous measurements from the satellite and from ground observatories. The storage regime made it possible to extend continuous measurements for periods of several revolutions, including passes over the auroral zones in the Arctic and Antarctic and over the polar caps as far as invariant geomagnetic latitudes 82-85°. During the initial period the satellite apogee was at 670 km and perigee was at 217 km, but it finally

/1-

AP0042570.

burnt up upon entering into the dense layers of the atmosphere on 12 February 1969 after making 857 revolutions of the earth. The experiment lasted 53 days. The orbit was such that in the northern hemisphere middle and high latitudes the satellite moved below or close to the maximum of the F-region so that ionospheric electron density along its trajectory and its variations could be determined in a number of regions on the basis of measurements by ground ionospheric stations. The period of the experiment included both quiet periods and those with strong disturbances. The experiment was conducted under the "Program of Cooperation Among Socialist Countries in the Field of Space Research and Peaceful Use of Space." Ground measurements were made in Bulgaria, Hungary, East Germany, Poland, Rumania, USSR and Czechoslovakia. Observatories and special expeditionary stations in the USSR participated: in Yakutia, the Far North, Siberia and middle latitudes. The article cited below is divided into four parts: 1) Description of Experiment; 2) Measurement of Low-Energy Electrons; 3) Measurement of Low -Energy Ions; 4) Measurements of Charged Particles with Intermediate and High Energies. Parts 2)-4) are essentially independent articles and are abstracted separately.

"The Influence of Intense Mental Work During the Day and Night Hours on the  
Excretion of Catecholamines in the Urine"

Leningrad, Fiziolicheskiy Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 8,  
Aug 73, pp 1,151-1,157

**Abstract:** The excretion of catecholamines in the urine was studied for 68  
railway employees who alternated day and night shifts. In the daytime,  
operators and on-duty men exhibited only a decrease in the reserve capacities  
of the sympatho-adrenalin system, while dispatchers, said to do more intense  
work, also showed an increase in noradrenalin excretion. During the night  
shift the dispatchers showed a larger increase in adrenalin excretion than  
other railway workers, though less than a control group not accustomed to  
night work, and a larger increase in noradrenalin excretion than either group.  
Dispatchers also increased their excretion of the dihydroxyphenylalanine  
1/2

precursor. The operators and on-duty men showed a larger increase in nor-adrenalin excretion during the night work than the controls. Excretion levels returned to the initial on the second day of rest. These results are said to show that even after many years of adaptation to a certain type of neuro-emotional work the excretion of catecholamines still depends on the intensity of the work, and that adaptation to night work is more difficult than to day work.

QUANTUM OSCILLATIONS OF PHOTOMAGNETIC EFFECTS  
AND PHOTOCONDUCTIVITY IN InSb AND InAs

Kikoin, I. K.; Lazarev, S. D.; Shepel'skiy, G. A.;  
Yefremova, G. D.

Quantum oscillations of photomagnetic phenomena in the degenerate semiconductors  $n$ -InSb and  $n$ -InAs are investigated in magnetic fields up to 50 kOe and temperatures between 1.8 and 4.2° K. At magnetic field strengths at which the photomagnetic e.m.f. changes sign (anomalous region) a pronounced nonlinear dependence of the photomagnetic effects on incident light intensity is observed under conditions of weak illumination ( $\Delta n \ll n$ ). With increase of light intensity the photomagnetic e.m.f. passes through a maximum and then changes sign. Photoconductivity in a magnetic field was studied in the same samples. A negative photoconductivity in a transverse magnetic field was observed. A theoretical interpretation of the anomalous phenomena apparently requires that the role of hot electrons be taken into account.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A MODEL OF METALS IS CONSIDERED IN WHICH ELECTRONS CAN EXIST IN ALMOST FREE STATES AND ALSO BE LOCALIZED AT NODES IN THE D PRIME1 AND D PRIME2 STATES OF THE ATOMIC D SHELLS. THE FERMI ELECTRON EXCITATION SPECTRUM IS FOUND BY TAKING INTO ACCOUNT HYBRIDIZATION OF THE STATES AND INTRA ATOMIC INTERACTION OF THE D ELECTRONS. THE INFLUENCE OF THE INDICATED INTERACTIONS ON MAGNETIC PROPERTIES OF THE SYSTEM IS INVESTIGATED AND IT IS SHOWN THAT WHEN THE NUMBER OF ELECTRONS ON THE ATOM N LESS THAN OR SIMILAR TO 2, FERROMAGNETIC ORDERING IS POSSIBLE AND ENERGETICALLY PROFITABLE.

"Natural Reservoirs and Foci of Leptospirosis"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 9, 1972,  
pp 106-110

**Abstract:** From the epidemiological standpoint, there are 3 kinds of foci of leptospirosis each of which possesses several reservoirs of the infection: natural, rural, and urban. The main reservoirs in the natural focus are murine rodents, insectivorous and possibly game and predatory animals. Farm animals, pets, and in part murine rodents are the reservoirs in a rural focus. The reservoirs in an urban focus are rats, dogs, and possibly cats. In all 3 foci human beings become infected by coming in contact with the animals or their excretions directly or through consumption of contaminated water or food. The methods needed to prevent and control leptospirosis must be chosen with regard to the peculiarities of the area affected.

KIKVADZE, N. N.**"One Realization of ALGOL-60"**

Tr. Vychisl. Tsentr. AN Gruz SSR [Works of Computer Center, Academy of Sciences, Georgian SSR], Vol. 9, No. 3, 1970, pp 16-57 (Translated from Referativnyy Zhurnal Kibernetika, No. 4, April, 1971, Abstract No. 4 V660 by V. Mikheev).

Translation: A description is presented of a translator for ALGOL-60, developed at the computer center of the Georgian SSR Academy of Sciences in 1966-1967. The translator is composed for a three-address computer with a memory capacity of 2048 42-bit words, 4-magnetic drums with a total capacity of  $4 \times 2048 = 8192$  words, one index register, a punch card input, and a printer output. The computer operates with an average speed of 8,000 operations per second in a floating point mode, and the instruction system contains the arithmetic and logic operations usually encountered in computers, control operations and operations on codes. The input language for the translator is a reduced version of ALGOL-60 (IFIP subset) with the following changes: 1. rows and descriptors are eliminated in descriptions of types and files; 2. identifiers are differentiated only in the first 8 characters; 3. the number of formal parameters of one procedure cannot exceed 23; 4. files with dimensionalities of not over 3 are permitted, while the number of identifiers of files included in one segment cannot exceed 9; 5. additional operators -- the input and output operators, simplified versions of the corresponding input and output operators of ALGAMS -- are included.

"Hamiltonian Cycles in a Homogeneous Graph of Power 5"

Garmil'tonov Tsikl v Odnorodnom Grafe Stepeni 5 [English Version Above], Riga, 1972, 9 pages (Translated from Referativnyy Zhurnal Kibernetika, No 4, 1973, Abstract No 4V419 DEP, by the author).

Translation: One sufficient condition for existence of a Hamiltonian cycle in an ordinary homogeneous graph of power 5 is studied. The following theorem is proven:

Theorem. If the surroundings of all points of a homogeneous connected graph of power 5 are connected, there is a Hamiltonian cycle in this graph. The surroundings of a given point in this case refer to the subgraph generated by all adjacent points.

During the course of the proof, a method is demonstrated, which can be used, beginning with any simple cycle, to construct a sequence of simple cycles of increasing length until a Hamiltonian cycle is produced.

"Interaction Between an Electron Beam and the Plasma of a Solid"

Leningrad, Fizika Tverdogo Tela, Vol 15, No 2, Feb 73, pp 622-623

**Abstract:** In a previous paper (Fizika Tverdogo Tela, Vol 14, 1972, p 2231) the authors showed that the longitudinal waves excited by a nonrelativistic electron beam in the plasma of a solid are the normal modes with accuracy to terms of the order of  $v_0/c \ll 1$ . Axially symmetric modes with  $l=0$  were treated there for the sake of simplicity. In this paper the authors study excitation of arbitrary electromagnetic waves with  $l \neq 0$  in the absence of an external magnetic field. Using Maxwell's equations and the expression for the operator of the tensor of permittivity, they derive differential equations for the fields  $E$  and  $B$ . It is shown that the mode with largest  $Z$  has maximum efficiency of conversion, which is determined from the condition of smallness of transverse diffusion. The efficiency of conversion for axially asymmetric modes increases with a reduction in  $\omega_0 a/v_0$ .

"Radiation Yield of a Solid-State Plasma during the Development of Beam Instability"

Leningrad, Fizika Tverdogo Tela; August, 1972; pp 2231-5

**ABSTRACT:** The possibility of the generation and amplification of electromagnetic waves by means of an electron beam passing through a cylindrical slit in a solid is studied. It is shown that potential oscillations in such a system, studied earlier, are natural, with an accuracy up to the terms  $v_0/c \ll 1$ . One of the modes of quasi-longitudinal oscillations has a maximum increment. The Umov-Poynting vector, connected with this mode, and the efficiency factor of the transformation of energy of the beam into energy of transverse electromagnetic radiation are found. At the same time, nonlinear theory is used to determine the amplitude of the steady-state oscillation. A definite advantage of the perturbation of surface over spatial oscillations is indicated.

The article includes 19 equations. There are four references.

"Perturbation of Longitudinal Electromagnetic Waves by an Electron Beam in the Plasma of a Solid"

Leningrad, Fizika Tverdogo Tela, January, 1972, pp 183-6

**Abstract:** The authors studied the possibility of the generation and amplification of longitudinal electromagnetic waves by means of an electron beam passing through a cylindrical aperture in a solid specimen, with and without an external longitudinal magnetic field. The effect of the dissipative mechanism of scattering of current carriers in the solid on the development of instability was determined. It was shown that perturbation of oscillations is possible not only under conditions in which the increment of increase is larger than the effective frequency of collisions of free carriers but also in the opposite case. In the latter case there is already a spectrum of perturbed oscillations. The threshold points of the electron beam above which the development of an instability takes place were determined. An evaluation of the amplitude of the non-linear oscillations occurring was made.

"The Exclusion Principle as One Approach to Pattern Recognition"

Nekotor. zadachi raspoznavaniya obrazov i teorii grafov [Some Problems from Pattern Recognition and Graph Theory -- Collection of Works], Tbilisi, Metsniyereba Press, 1972, pp 31-36 (Translated from Referativnyy Zhurnal - Kibernetika, No 8, 1973, Abstract No 8 V696 by V. Mikheyev)

Translation: The method suggested for recognition is included in the group of methods in which a pattern is distinguished by man and only recognized by machine. Suppose there are  $m$  classes ( $s_1, s_2, \dots, s_m$ ) of objects to be recognized. The input of the machine receives not the object itself, but rather only its properties. The set of these properties is a description of the object or its mapping. Using this mapping, the machine creates (restores) a pattern corresponding to each class  $s_i$  and concludes that the object, the mapping of which was received at the input, belongs to class  $s_i$ . It is assumed in this case that each object is characterized by a finite number of parameters.

Translation: Methods of solution of the following problem are studied. Suppose  $\Theta = \{\theta_i\}$  is a finite set of objects, in which the subdivision into classes of equivalence by condition R is defined. By R we mean similarity, i.e., objects with same nomenclature are considered to be equivalent or to be included in the same class. In this case,  $\Theta$  becomes the union of the intersecting classes  $\Theta = \bigcup_k S_k$ , while the set of such classes is a factor-set in relationship to equivalence R. One and only one element of set  $\Theta/R$  corresponds to each element of set  $\Theta$ , but not vice versa. For each element  $\theta_i \in \Theta$ , condition R allows us immediately to determine class  $S_k$ , of which

Tr. in-ta elektron. avtomatiki i telemekh. AN Gruz SSR (Works Of The Institute Of Electronic Automatics And Telemechanics, Academy Of Sciences, Georgian SSR), 1970, 8, No 2, pp 66-71 (from RZh--Elektronika i yesya primeneniye, No 11, November 1970, Abstract No 11B498)

Translation: In order to regulate a-c voltage with a power above 0.5 kw with great precision and small nonlinear distortion, it is advisable to use regulators with a saturation choke connected to the primary winding of an autotransformer. An electron-tube diode is used in the sensor [datchik] of effective voltage. In the circuit at 3 kw a control circuit using transistors is employed and in the circuit at 0.5 kw, a control circuit using tubes. The basic parameters of the regulators with an output voltage of 220 v plus or minus five percent at 3 and 0.5 kw, respectively, are: load current 13.6 and 2.3 amp; specific power 45 and 25 wt/kg; coefficient of nonlinearity distortion 5 and 4 percent; temperature range from 5 to 50° C and from 10 to 40° C. 2 ill. 2 ref. "Coupled Thermoelastic Perturbations in a Half-Space When its Surface is Subjected to Thermal Shock, Assuming a Finite Rate of Heat Propagation"

Kiev, Dopovidi Akademii Nauk Ukrains'koi RSR, Seriya A: Fizyko-Tekhnichni ta Matematychni Nauki, No 4, Apr 71, pp 368-371

**Abstract:** An investigation is made of the propagation of coupled thermoelastic disturbances when a constant heat flux is suddenly incident on the surface of a half-space. A self-similar solution of the traveling wave type in the one-dimensional connected problem of thermoelasticity is found. The rates of propagation of plane traveling wave fronts are determined. Special cases are considered with the most extensively used simplifications: absence of coupling between elastic and temperature fields, and infinite rate of heat propagation. It is shown that if the coupling effect between elastic and temperature fields is disregarded, stresses increase without limit on the acoustic wavefront and wave resonance takes place.

of Medical Sciences, Leningrad. The Department of Biochemistry, Institute of Experimental  
and Clinical Medicine Estonian SSR Ministry of Health, Tallinn

Activities of hexokinase, glucokinase and fructokinase, and dehydrogenases of  
glucose-6-phosphate and 6-phosphogluconate in cytostructures of slowly-growing (hepa-  
toma 48 and 46) and rapidly-growing (hepatoma 22) transplanted hepatomas of C<sub>3</sub>HA  
mice were studied. Specific activity of hexokinase is significantly elevated in soluble  
as well as in mitochondrial fractions of all hepatomas studied. The specific activity  
of glucokinase in soluble fraction of slowly-growing hepatomas was more than in the

42

2

REEL/FRAME  
19730164

AP0037239

control. This may be connected with substantial decrease in protein content in this fraction of hepatomas. The specific activity of hepatomas glucokinase in mitochondria from hepatomas 48 and 46 was significantly lower than in the control, and does not developed in the tissue of rapidly-growing hepatomas. The specific activity of fructokinase in soluble fraction and mitochondria from slowly-growing hepatomas was slightly less than in the control. The activity of fructokinase in mitochondria of rapidly-growing hepatomas has not been noted. The specific activity of glucose-6-phosphate and 6-phosphogluconate dehydrogenases is sharply increased in soluble fraction of both slowly-growing and rapidly-growing hepatomas.

"Investigation of Load Carrying Capacity of Reinforced Panels  
in Acoustic Field"

Kiev, Prikladnaya Mekhanika, Vol 7, No 12, 1971, pp 82-86

Abstract: Cylindrical panels reinforced by stiffeners and subject to axial load in an acoustic field were investigated. The spacing between axial stiffeners was ten times the geometric mean between the radius of curvature and the wall thickness. The sound pressure level was 164-168 decibel, the frequency was about 300 hertz, which was close to resonance. The following results were obtained:

1/2

USSR

KIL'DIBEKOV, I. G. et al, Prikladnaya Mekhanika, Vol 7, No 12, 1971 pp 82-86

1. The acoustic field resulted in the reduction of load carrying capacity by 5 to 7%.

2. The maximum vibrations of the panel in the acoustic field occur under axial load causing local buckling.

3. Fatigue cracks appear at the stress concentration areas such as the riveted joints.

Photographs of static and fatigue failures are given.

**TWO-STAGE PARAMETRIC EXCITATION OF THE MAGNETOACOUSTIC RESONANCE IN XRD DISKS BY PARALLEL PUMPING**

*V.N. KILDISHEV, R.V. MUSOVSKY*

Institute of Radio & Electronics Academy of Sciences of USSR, Moscow, USSR

The results of S-band experiments on parametric excitation of magnetooacoustic resonance (MAR) in ferrite XRD disks with polished surfaces by parallel pumping are presented. The threshold power of the MAR excitation was measured above than that of spin wave instability. The excitation of two-stage oscillations in disks with different size with the diameter of 10 mm, applied parallel to the face of the disk is observed. In Fig. 1 the threshold power of MAR as a function of the static magnetic field is presented ( $\delta H = H_0 - H_{\text{th}}$ , where  $H_0$  is the applied static magnetic field, and  $H_{\text{th}}$  is the field corresponding to the point of minimum threshold of subsidiary absorption by parallel pumping).

In the region of subsidiary absorption the excitation of MAR is accompanied by the phenomena that resemble those which are present in MAR excitation in the region of ferromagnetic resonance [1], that is: not longitudinal elastic waves are excited, but there a great number of harmonics is observed, and the calculated values of the elastic response frequency for the main (the lowest) type of oscillation well agree with experimental one only with assumption that disks are bars factured by the per-

imeter.

By means of the method of construction of inequality surfaces (2) it is shown, that on two-stage mechanism excitation of MAR the wave number of pumping wave is governed by the equation

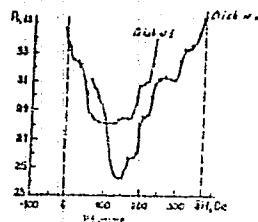

$$k = \frac{\omega_{\text{th}}}{c} k_{\text{max}}$$

(where  $\omega_{\text{th}}$  is the velocity of the elastic waves), for XRD the values of  $k_{\text{max}}$  are equal to  $10^4 \text{ cm}^{-1}$ , that is in two-stage MAR the second pumping wave is not exchange spin wave, but magnetostatic one. The region of the

static magnetic field, where the two-stage MAR can exist, has the following limits

$$H_0 M_s - 2M_s \leq 2\pi m_p^2 \cdot (4/3)^2 \leq H_0 \leq \omega/c + N_z M_s$$

where  $N_z$  is the demagnetization factor in the direction

of the static external magnetic field  $H_0$ . In Fig. the theoretical limits of MAR existing are shown by dotted lines. A good accordance with experimental data takes place.

"Synthesis of Some O,O-Diethyl-S-( $\beta$ -Acylaminoethyl)-dithiophosphates"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 4, Apr 72, pp 479-482

Abstract: Ethyleneimides of N-phtalyl-D,L-valine, -glycine, -D,L-alanine, N-carbobenzoxo-D,L-valine, N-benzoyl-D,L-leucine,  $\gamma$ -methyl ether of N-carbobenzoxo-L-glutamic acid, and monomethyl ester of succinic acid were synthesized and reacted with O,O-diethyldithiophosphoric acid in methanol to yield respective O,O-diethyl-S-( $\beta$ -acylaminoethyl)-dithiophosphates. All of these compounds exhibited intensive doublets at 655-660  $\text{cm}^{-1}$  in their IR spectra, indicating the presence of the  $\text{O}'\text{p}\equiv\text{S}-\text{C}$  grouping. Synthesis of

$\beta$ -chloroethylamides of N-phtalyl-D,L-valine, m.p. 131-132°C, N-acetyl-D,L-valine, M.p. 175-177°C, and monomethyl ester of succinic acid, b.p. 141-142/1.5 mm,  $n_D^{20}$  1.4854,  $d_4^{20}$  1.2480, are also reported.

"Hyperspherical Functions in the Five-Body Problem"

Moscow, Yadernaya Fizika, Vol 14, No 3, 1971, pp 551-566

**Abstract:** An algorithm for constructing a system of hyperspherical functions for the quantum-mechanical five-body problem is considered. First a reduction is carried out, beginning with the step  $O_4 \supset S_5$ , an embedding problem. Then suitable kinematic variables are introduced. It is thereupon explained which representations of  $S_5$  are contained in the irreducible representation  $O_4$ . Next, employing suitable notation, projective operators are used to construct the matrix for the transition from the basis  $O_4 \supset O_3 \supset O_2$  to the basis

$O_4 \supset S_5 \supset S_4 \supset S_3 \supset S_2$ . Another possible reduction chain

$$\begin{array}{c} O_4 \supset O_2 \otimes O_2 \\ \cup \quad \cup \quad \cup \\ S_5 \supset S_3 \otimes S_2 \end{array}$$

1/2

KILDYUSHOV, M. S. and SURKOV, YE. L., *Yadernaya Fizika*, Vol 14, No 3, 1971,  
pp 551-566

is considered, which corresponds to separating subsystems of two and three particles and which is better adapted for computing matrix elements of two-particle operators. An appendix derives matrixes for the transition from the first basis to the second. Finally, a last section presents the reduction  $O_{12} \rightarrow O_3 \otimes O_4$  and computes the spectrum of representations when  $k < 5$ . The algorithm is formulated concisely in the concluding section.

"Experimental Study of Certain Parameters of Ionized Air Before a Strong Shockwave"

Mekhanika Zhidkosti i Gaza, No 6, 1971, pp 17-22.

**ABSTRACT:** A resonant superhigh frequency probe is used to measure the electron density  $n_e$  before a strong shockwave in air. It is demonstrated that the results produced by this method agree well with results produced by ordinary probe methods. The method of electromagnetic induction is used to measure the rate of diffusion of electrons in the zone before the shockwave.

This work presents an experimental study of the parameters of ionized air before the leading edge of a strong shockwave in an electric discharge shock tube. The resonant system used is a sector of a wire line, short-circuited at each end, placed in the plasma being studied.

(from RZh-Meditsinskaya Geografiya, No 3, Mar 71, Abstract No 3.36.258)

Translation: During the last seven years, the incidence of typhoid has decreased each year by 6-7% on the average in this country. Maximum drops were observed in the Belorussian SSR, Kazakh SSR, Lithuanian SSR, Latvian SSR, Armenian SSR, and Estonian SSR; minimum drops were found in the Uzbek SSR and Kirghiz SSR. During the last two years, the incidence of typhoid was 10% higher among rural residents than among urban residents. In comparison with 1964, a drop in incidence of approximately 40% was observed; in rural locations, the drop was 23%. The leading significance of the water factor in transfer and distribution of the agent of typhoid is 1/2

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ADRENALS OF CATTLE AND HUMAN SUBJECTS WERE ANALYZED BY ELECTROPHORESIS AND IMMUNOELECTROPHORESIS IN AGAR GEL. THE ANTIGENIC COMPN. INCLUDED 5-7 FRACTIONS CORRESPONDING TO THE ALPHA SUB2, ALPHA SUB1, BETA AND GAMMA GLOBULINS AND TO SOME ALBUMINS PRESENT IN BLOOD SERUM. HUMAN ADRENALS IN THE FRESH STATE (WITHIN 12 HR AFTER DEATH) CONTAINED MORE FRACTIONS. DURING PRESERVATION, E.G., WITH TYRODE'S FLUID, PROTEIN COMPD'S ARE WASHED OUT OF THE PREPAS. THE ADRENAL TISSUE IS METABOLICALLY ACTIVE, ESP. IN THE 1ST 10 DAYS OF PRESERVATION. IT IS RECOMMENDED THAT HUMAN ADRENALS BE USED FOR TRANSPLANTATION WITHIN 10-15 DAYS AFTER COLLECTION AND PRESERVATION. FACILITY: KUBAN. MED. INST., KRASNODAR, USSR.

"Specialized Digital Measuring Unit"

Tr. Mosk. energ. in-ta (Works of the Moscow Power Engineering Institute), 1972, vyp.154, pp 133-133 (from RZh-32. Metrologiya i Izmeritel'naya Tekhnika, No 5, 1973, Abstract No 5.32.60)

Translation: The authors present a short description and the technical characteristics of a digital unit developed by the Department of Information-Measurement Technology of the Moscow Power Engineering Institute for the remote control study of high-speed processes. This unit in some ways satisfies current requirements. The unit consists of three blocks: analog-digital converter, a remote block, and a matching block. The analog-digital converter and the remote block are connected by a cable communication line 250-500m long. The following are the basic technical data of the digital remote control unit model: nominal value of the input voltage  $U_{\text{nom.}} = 100\text{mV}$ ; fundamental error of the measurement result at the most sensitive limit does not exceed  $\pm (0.05-0.025 \frac{U_{\text{nom.}}}{U_x})$  percent; maximum sensitivity is not less than

"Concerning the Criteria of Optimal Planning and the Limit-State Parameters of Buildings in Calculations for Seismic Effects"

Moscow, Stroitel'naya Mekhanika i Raschet Sooruzheniy, No 6, 1970, pp 29-34

Abstract: The article deals with the calculation criteria of optimal structures in the case of seismic effects with account taken of their recurrence and intensity. An analysis is made of various relationships of the "restoring force - movement" type for elastoplastic systems and systems with brittle local failures. A study is made of the conditions of the stability of forced oscillations of systems with nonlinear restoring relationships. 9 figures, 9 bibliographic entries.

243917 MEASURING SPEED OF CHANGE OF PRESSURE can be used for research into dynamic processes in hydraulic systems. The measuring device contains a flexible unit, forming together with the housing of the apparatus two cavities, one of which is connected directly by a pipe with the controlled object, and a second connected through a hydraulic resistance. The sensitive unit is in the form of two symmetrically placed bellows, joined together by a flexible unit such as a spring in the centre of which there is a device for transforming displacement into an electrical signal. The device consists of housing 1 in which are housed bellows

2 and 3. Between these is placed rod 4 at the ends of which are fitted springs 5 and 6.

The springs rest on the bottom of the bellows. Cavities 7 and 8 between the bellows and the housing are connected to the hydraulic system the dynamic processes of which are analysed.
