ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS CONVENED A CLINICO LABORATORIAL ANALYSIS OF 44 CASE HISTORIES OF PATIENTS WITH PROGRESSIVE LEUKOENCEPHALITIS AND NEUROECTODERMAL BRAIN TUMORS. SPECIAL ATTENTION IS BEING GIVEN TO PSEUDOTUMOROUS SYMPTOMS IN DIFFERENT FORMS OF PROGRESSIVE LEUKOENCEPHALITIS (SCHILDERS, SCHOLL, VAN BOGAERTS DISEASE). FOR DIFFERENTIAL PURPOSES THE AUTHORS UTILIZED OTONEUROLOGICAL AND X RAY CONTRAST METHODS, AS WELL AS EEG DATA. THE PEG OF PATIENTS WITH PROGRESSIVE LEUKOENCEPHALITIS DISPLAYED AN OPEN INTRAHYDROCEPHALIA WITHOUT A DISPLACEMENT OF THE VENTRICULAR SYSTEM. THE EEG CHANGES WERE IN THE FORM OF A DIFFUSE DISORGANIZATION OF THE RHYTHMS WITH A LOW AMPLITUDE ACTIVITY OR HIGH VOLTAGE PAROXYSMS OF ACUTE AND SLOW WAVES. THE OTONEUROLOGICAL CLINICAL PICTURE IN PROGRESSIVE LEUKOENCEPHALITIS IN COMPARISON TO TUMORS WAS CHARACTERIZED BY MULTIPLE FOCI, SUB AND SUPRATENTORIAL SYMPTOMATOLOGY. THIS INDICATES NOT ONLY TO A LESION OF THE HEMISPHERES, BUT OF THE STEM STRUCTURES AS WELL. "Study of a Turbulent Jet on a Penetrable Plate"

Minsk, Teplo- i Massoperenos (Heat and Mass Transfer), Vol 1, 1972, pp 212-218; (Referativnyy Zhurnal, Series 41, No 6, 1972, Abstract No 6.41.169)

Abstract: Transverse input or discharge of matter in a boundary layer is one of the effective methods of influencing the structure of flow and the condition of heat exchange in the boundary layer; it may be used to diminish surface friction, prevent breakaway of flow, secure thermal shielding of surface, etc. The given paper is devoted to an experimental study of the motion of an isothermal jet along a penetrable plate in the presence of homogeneous injection or suction of air across a plate. Given are the design of an experimental apparatus and the results of the experiment. Bibliogr. 5, illus. 5.

"Investigation of the Series of Phosphinic and Phosphinous Acid Derivatives. XI. Effect of the Structure of Alkyl Halide on the Reaction With Esters of Ethyl(Phenyl)dithiophosphorous Acid"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 8, Aug 73, pp 1701-1705

Abstract: The study included reactions of normal and branched alkyl halides with dipropyl esters of ethyl- and phenyldithiophosphorous acids. The normal alkyl halides react much faster in this reaction than the branched alkyl reagents. The reaction can be described by the equation $RP(SC_3H_7)_2 + R'Br \rightarrow RR'P(S)(SC_3H_7) + RR'_2P(S) + RP(S)(SC_3H_7)_2 + C_3H_7Br + R'SC_3H_7$

as supported by NMR ^{31}P data. It was shown that changing from normal alkyl halides to the branched isomers increases the tendency of this reaction to occur via the sulfur atom rather than through the phosphorus atom.

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70,
pp 2001-2004

Abstract: The reaction of ethyl esters of diethylthiophosphinous acid (I) and diethylphosphinous acid (II) with acetaldehyde is reported. Both esters react by the same mechanism with acetaldehyde. The reaction is complicated in case of (I) by decomposition of the starting material with the formation of triethylphosphine and the ethyl ester of diethyldithiophosphinic acid. It is proposed that the reaction of ethyl esters of (I) and (II) with acetaldehyde is a nucleophilic replacement reaction probably going through the formation of an intermediate cyclic complex. The proton is split

"Reaction of Phosphorus Pentachloride With Isoprene Hydrochlorides"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 5, May 73, p 1197

Abstract: Studying the effect of two electron donating and one electron accepting substituents at the olefinic bond on the phosphorylation the reaction of phosphorus pentachloride with primary and tertiary isoprene hydrochlorides was studied. It has been shown that in both cases the reaction leads to the products of chlorination and phosphorylation. In the process 1-chloromethyl-2-chloro-2-methylpropylphosphonic acid dichloride was synthesized which could undergo dehydrochlorination after prolonged heating to yield k-chloromethyl-2-methyl-propenyl-1-phosphonic acid dichloride.

"A Ballistic Wind Tunnel for Measuring the Drag of Models in Free Flight at Hypersonic Velocities"

Uch. zap. Tsentr. aerogidrodinam. in-ta (Scientific Notes of the Central Aerohydrodynamic Institute), 1970, 1, No 2, pp 111-114 (from RZhM-Mekhanika, No 9, Sep 70, Abstract No 9B497)

Translation: The authors describe a ballistic wind tunnel and some of the experimental data obtained in this tunnel. The installation comprises three main elements: the wind tunnel ($M=2.5\text{-}3.5$, total braking pressure up to 200 atmospheres), a pointer stand (caliber 14.5 mm, flight speed of the models up to 500..2,000 m/s) and electron-optical instrumentation. The operation of the installation is based on shooting the model into the teeth of the supersonic flow in the tunnel. The unit permits achievement of Mach numbers of 1.5-1.5, Reynolds numbers of $10^4\text{-}10^7$, and a stagnation temperature of up to 2,800°K. Data are given on the head drag coefficient of a conical model with generatrix discontinuity, and elliptical cones, as well as a relationship for development of the width of the turbulent kernel in the wake of a sphere (in the caliber range of $\delta = 30\text{-}3,500$, development of the relative width of the turbulent wake δ is approximated by the expression $\delta = 0.2004E^{0.5}$). "Nature Is Our Friend"

Vil'nyus, Sovetskaya Litva, 3 Apr 73, p 2

Translation: The protection of nature is a nationwide task in our country. In the December 1972 decree of the CPSU Central Committee and the USSR Council of Ministers entitled "On Strengthening the Protection of Nature and Improving the Use of Natural Resources," comprehensive steps are envisioned to insure the protection of open bodies of water, soil, and atmospheric air against the potential danger of pollution. However, the effectiveness with which measures to protect nature are carried out depends to a large extent on the participation by broad layers of the population in this great and important cause and on involving sanitation activists in the struggle for a clean environment, for decontaminating the environment in which man lives.

As we know, chemical and bacterial contamination of objects in the external environment results primarily from human labor activity. For example, the enormous successes of chemical science and the introduction of a large number of new synthetic compounds into everyday life and various areas of the

USSR

KRASIL'SHCHIKOV, D., Sovetskaya Litva, 3 Apr 73, p 2

national economy involve a danger of contaminating the external environment with various chemical agents, many of which are capable, under certain conditions, of negatively affecting the human organism and the plant and animal world.

The consumption of toxic agricultural chemicals in our republic each year is comparatively small. Of the total number of pesticides used in the agriculture of the Lithuanian SSR, of herbicides for combating weeds comprised a significant share, and they decompose in the external environment relatively quickly. At the same time, ignoring existing sanitary rules for storing, transporting, and using toxic chemicals may cause intensive contamination of the soil and the agricultural crops raised on it. Atmospheric precipitation washes the pollutants into open bodies of water where certain toxic chemicals are capable of accumulating in significant quantities in both water plants and in fish.

The spring months are the period of intensive field work involving the use of toxic chemicals. That is why sanitation activists in the countryside and all people engaged in work with toxic chemicals should intensify checks to see that measures are followed to bar the possible contamination by toxic agricultural chemicals of the soil, air, open bodies of water, and other objects of the external environment.

2/4

USSR

KRASIL'SHCHIKOV, D., Sovetskaya Litva, 3 Apr 73, p 2

Winter is past and the snow has melted, exposing accumulations of garbage at certain places in cities and populated points. Eliminating them is one of our paramount tasks. And this must be done quickly, before they become a reproduction area for flies. "Natural" dumps and accumulations of garbage along the banks of open bodies of water present a special danger because, with spring precipitation, the chemical and bacterial pollutants will rapidly penetrate the open bodies of water.

According to a tradition established for many years in the Lithuanian SSR, April is the month of a broad public movement for cleanliness and health.

This year too, a great deal is to be done in the struggle to protect nature, further increase the sanitary level and cleanliness of the cities and communities of the republic, and clean up pollution of the external environment. Winter accumulations of garbage are to be cleared from the city; steps will be taken to plant streets and squares with greenery, and the banks of rivers and lakes will be cleaned up.

Petroleum products are among the pollutants which significantly retard natural self-decontamination processes. Even one case of contamination of water with gasoline, kerosene, mazut oil, or other petroleum products has a negative effect on the oxygen system in bodies of water and hinders the beneficial processes taking place in them by which organic pollutants are

USSR

KRASIL'SHCHIKOV, D., Sovetskaya Litva, 3 Apr 73, p 2

mineralized. Therefore, concern for preventing the contamination of open bodies of water with petroleum products should be at the center of attention for sanitation activists in the republic. Washing motor vehicles and tractors in lakes, ponds, and rivers should be banned in all places; special areas should be outfitted for this purpose and other rules which prohibit contaminating the soil and open bodies of water with petroleum products should be followed strictly.

In the system of measures to clean up populated points, a special place belongs to repairing individual and public use wells, garbage collection points, and so on and putting them in proper sanitary-technical condition. Timely decontamination of wells and insulating them against rain and surface waters will help preserve satisfactory quality in drinking water. Sealing off places where garbage and waste products are collected will prevent the accumulation of flies.

The struggle for cleanliness and order in populated points is an inalienable part of the struggle for health and sanit... sophistication. No one should be indifferent in this great and important work. We will make our cities and towns flourishing gardens of cleanliness and health.

KRASIL'SHNIKOV, D. G.**"Problem of the Combined Effect of DDT and Alkylbenzenesulfonate on the Organism of White Rats"**

V sb. Vopr. epidemiol. i gigiyeny v LitSSR (Problems of Epidemiology and Hygiene in the Lithuanian SSR -- collection of works), Vil'nius, 1971, pp 173-174 (from RZh-Farmakologiya. Khimoterapevticheskiye sredstva. Toksikologiya, No 2, Feb 72, Abstract No 2.54.785)

Translation: Rats ♂ were injected intraperitoneally once or repeatedly with various doses of DDT, NP-1 sulfonol (alkylbenzenesulfonate) and a binary mixture of them (binary mixture; ratio of 1:1 in doses causing an equivalent toxic effect). On multiple injection of the binary mixture at the toxic dose level and single access of it to the organism on the fatal dose level, predominance of the DDT toxic effect was noted. This is connected with the emulsifying effect of the alkylbenzenesulfonate as a result of which the conditions of absorption of the DDT out of the ZAKT are improved. The cumulative factor was 2, 0.4 and 0.33 respectively for alkylbenzenesulfonate, DDT and a binary mixture of them.

INVESTIGATION INTO SECONDARY PERISTALSIS IN VARIOUS PARTS
OF ESOPHAGUS IN DOG

Bogach, P. G.; Krasil'shchikov, K. B.; Grossman, S. D.

From the Institute of Physiology, T. G. Shevchenko State University, Kiev

In spite of the different character of the motor reactions in various parts of the esophagus to mechanical stimulation the frequency of the secondary peristalsis in all parts of the dog esophagus was shown to be the same, viz. 8-14 contractions a minute.

The frequency of the peristalsis in esophagus appears to be unchanged with the increase of the stimulating balloon volume by 4 times (10--40 ml.). Only the strong mechanical stimulation of esophagus which evoked pain depressed the secondary esophageal peristalsis. The excitability of esophagus to mechanical stimulation had a tendency to increase in distal direction.

V. Tikhonov, V. K. Kostylev, N. G. Poroshenkov
KOMPRESORNOY MOSKOV. SOTSIETI, 1972, pp. 1-271

The analysis of the operation of various control systems that in spite of the significant achievements in the field of improving the methods of regulation permitted quite efficient utilization of the methods in the compressor sections of industrial enterprises, they are characterized by certain deficiencies. For example, the effort to have the system maintain a constant pressure in the compressor station receiver independently of load at the same time as it would be more difficult to size the receiver to compensate for the increasing pressure losses in front of the regulator with an increase in flow value and the rate of variation of the controlled pressure does not depend on the pressure variation rate. The more advanced regulating units operate by the method of cyclic pulse alternation which is sufficiently effective when servicing technological pro-

cesses has led to different types of measures with respect to improving the existing regulation procedures; however, these measures do not solve all of the problems connected with improving the quality of the transient processes. There significantly complicates the regulating units and, as a consequence, they do not find practical application in industry.

The method of multi-position regulation of the piston compressors developed by the All-Union Scientific Research and Planning and Design Process Institute of Chemical Machine Building jointly with the Control Problems Institute [1] and its

"Diffraction of an Acoustical Wave on a Fixed Plate"

Moscow, Mekhanika zhidkosti i gaza, No. 2, Mar/Apr 72, pp 123-130

Abstract: The problem of determining the velocity field excited by an acoustical wave incident on a fixed plate is considered as a boundary value problem with a moving boundary for a two-dimensional wave equation. This problem is solved by constructing and converting Volterra integral equations. The solution is obtained in closed form for an arbitrary angle of inclination of the front of the incident wave to the surface of the plate and is represented in the form of recurrent formulas taking into account the effect of any number of diffraction waves arising in sequence at the boundary of the plate. It is assumed that the weak shock wave propagates in an infinite volume of ideal gas and that the shock wave front is a plane moving with the speed of sound. The shock wave is incident on the fixed plane plate and the velocity vector forms an arbitrary angle with the plane of the plate. After determining the velocity potential the pressure field is determined and the pressure distribution on the surface of the plate is found.

A70-24779 # A velocity field excited by wing vibrations propagating over a surface at a finite velocity (Pole skorosti, vozbuzhdennoe vibraciami kryla; raspredeleniye skorosti po poverkhnosti s konechnoi skorost'yu). E. A. Kralil' (Zhukova) (Akademiia Nauk SSSR, Institut Problem Mekhaniki, Moscow, USSR). (Academie Romaine and Ministerul Ministrului)

Conferinta Nationala de Mecanica Aplicata, Bucharest, Romania, June 23-27, 1969.) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee, vol. 15, no. 1, 1970, p. 131-140. 15 refs. In Russian.

Study of a gasdynamics problem regarding a velocity field excited by vibrations propagating over an elastic wing surface at a finite velocity. This gasdynamics problem is reduced to a boundary value problem with a moving boundary for a three-dimensional wave equation. A general method of solving three-dimensional boundary value problems is proposed for the case where the boundary conditions are given in one plane. The solution to the problem is obtained in closed form when the wing moves at a supersonic velocity according to an arbitrary law, the vibration propagation front is an arbitrary curve moving over the wing surface, and the edges of the wing are supersonic.

"Calculation of Efficiency and the Optimization of Parameters of Chemo-nuclear Plants"

Moscow, Atomnaya Energiya, Vol 33, No 4, Oct 72, pp 801-808

Abstract: The calculation of the efficiency and the optimization of channel parameters on a loop-like chemonuclear plant are carried out on the basis of a generalized model. The approximate solution of the function characterizing in general the efficiency of any chemoradiative apparatus is reduced to a numerical summation of the efficiencies of individual chemonuclear channels. This method, in combination with physico-neutron calculations makes possible the efficiency determination of various types of chemonuclear plants taking into account the dosage rate, temperature, reagent density, and other factors characterizing the actual conditions of experimental and industrial chemo-nuclear plants. The use of this method for the indicated calculations of the KhYu-5 chemonuclear plant resulted in optimization of its parameters. The possibility of the organization of an industrial synthesis of hydrazine on the basis of a chemonuclear reactor is analyzed on the example of a

1/2

USSR

reactor using chemonuclear fuel in the form of a 4 μ thick UO₂ layer built up on an aluminum base. The plotted calorific power dependence of the channel efficiency shows a linear character. The efficiency of other active zones of chemonuclear reactors can be calculated on the basis of this dependence. Four figures, two tables, nine formulas, twelve bibliographic references.

VOLYNSKIY, E. I., and KRASIN, L. A."Optimum Disposition of Managers on the Concluding Stages of Jobs"Mekhaniz. i avtomatiz. upr. Nauch.-proizv. sb. (Mechanization and Automation of Control. Scientific Production Collection), 1973, No 2, pp 16-18
(from RZh-Matematika, No 9, Sep 73, abstract No 9V580 by Yu. Finkel'shteyn)

Translation: In the critical path method of planning scientific research, design, construction, erection, and repair work, in order to minimize the deadline for job completion it is frequently necessary on the final stage to use rational placement of workers with regard to their productivity differences on uncompleted sections of the project. Let there be n uncompleted sections which can be worked on simultaneously, and M managers for placement on these sections. The volumes of job completion by sections a_1, a_2, \dots, a_n are given, as well as a matrix of interchangability τ_{ij} , $1 \leq i \leq n$, $1 \leq j \leq M$, where the elements τ_{ij} characterize the productivity of the j -th manager on the i -th section. If the subset of the numbers of managers, placed on the i -th section is designated by T_i , then the total productivity on section $a_i = \sum_{j \in T_i} \tau_{ij}$. The project can be finalized only when all jets

a_i ($i=1, \dots, n$) have been completed, the time for finishing a job on section i being $t_i = a_i/g_i$. It is required to so space the N managers (i. e. to break the set of numbers $R = \{1, 2, \dots, N\}$ down into nonintersecting subsets T_1, \dots, T_n) that $\max_{1 \leq i \leq n} (a_i/g_i)$ is minimized. An algorithm of branches and boundaries is constructed for the problem with regard to inherent idiosyncrasies.

"Optimal Placement of Actuators During the Final Stage of Work"

Mekhaniz. i Avtomatiz. Upr. Nauch.-Proizv. Sb. [Mechanization and Automation of Control Scientific-Production Collection], 1973, No 2, pp 16-18 (Translated from Referativnyy Zhurnal Kibernetika, No 9, 1973, Abstract No 9V580).

Translation: With network planning of scientific research, planning, construction-installation or repair work, in order to minimize the time required to complete an object, it is frequently necessary in the final stage to arrange workers on the job intelligently considering their different productivities among the uncompleted sections of the project. Suppose there are n uncompleted sections, work on which can be conducted in parallel, for which N actuators must be placed. The volumes of completion of operations by sectors a_1, a_2, \dots, a_n are fixed, as well as the matrix of interchangeability

$\{\tau_{ji}\}$, $1 \leq j \leq N$, $1 \leq i \leq n$, where elements τ_{ji} characterize the productivity of the j th worker in the i th section. If the subset of actuator numbers assigned to the i th section is represented by T_i , the total productivity in

the section

$$g_i = \sum_{j \in T_i} v_{ji}$$

The object can be completed only when all operations a_i ($i = 1, 2, \dots, n$) are completed, the time of completion of each operation in section i being $t_i = a_i/g_i$. The problem is to arrange the N workers (i.e., to divide the set of numbers $R = \{1, 2, \dots, N\}$ into nonintersecting subsets T_1, \dots, T_n) so as to minimize $\max_{1 \leq i \leq n} (a_i/g_i)$. Considering the specifics of the problem, an algorithm of branches and bounds is constructed for it.

"Experimental and Theoretical Investigations of Prestressed Reinforced Concrete I-Beams With Cracks When the Beams Operate Under Bending With Twisting"

Tr. Tashkent. in-ta inzh. zh.-d. transp. (Works of the Tashkent Institute of Railway Transportation Engineers), 1970, vyp. 68, pp 154-168 (from RZh-Mekhanika, No 4, Apr 71, Abstract No 4V832)

Translation: The paper presents the results of a study of a prestressed reinforced concrete beam of I cross section subjected to simultaneous bending and twisting. It is shown that the nature of crack formation during bending with twisting is practically no different from the nature of crack formation during simple bending. In the zone of pure bending, the cracks open out vertically, and in the support sections the cracks are inclined at an angle of 20-30° to the horizontal. Z. L. Gil'gur.

"Effect of Irradiation on the Properties of Welds of High-Alloy Steels and Alloys"
Moscow, Svarochnoye Proizvodstvo, No 3, Mar 70, pp 4-6

Abstract: The effect of neutron irradiation on the short-term mechanical properties of basic metals and welds from 00Kh16N15MoB, 0Kh16N15MoB, and Okh2Cr40B austenitic steels and 1Kh1323M ferrite-martensite steel was investigated. The mechanical properties were determined on samples cut in the longitudinal direction from argon-arc welds using an infusible electrode. The samples were irradiated in the active zone of a reactor at about 190°C. The theoretical neutron flux density was 10^{15} neutron/cm²· sec. Some samples received a dose of 2.8×10^{21} neutron/cm², while others received a dose of 4.3×10^{21} neutron/cm². The mechanical properties were determined on UHD-5 tensile testing machines at air temperatures of 20, 350, and 650°C.

1/2

USSR

BOTINOV, S. N. et al, Svarochnoye Proizvodstvo, No 3, Mar 70, pp 4-6

Tests conducted at 20°C showed that strength properties of all samples increased after irradiation; plasticity decreased. The tensile and yield strengths of weld metals with an austenitic structure increased to a lesser degree than those of the base metals. The mechanical properties of all samples at 350°C did not differ from those of the base metals. A decrease in tensile and yield strength with a simultaneous decrease in plasticity was observed in samples with an austenitic structure in tests conducted at 650°C. These decreases were especially noticeable in irradiated samples made from 40% Ni steel. The possible cause of the sharp decline in the intergrain strength and plasticity observed at 650°C in the irradiated metal with high nickel content is suggested. Orig. art. has: 2 figures, 4 tables, and 5 references.

"Characteristics of the Depressive Effect of Antilymphocyte Serum and Antilymphocyte Globulin on the Formation of Antibodies in Mice"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii,
Vol 48, No 2, Feb 71, pp 83-89

Abstract: Antilymphocyte serum was obtained by injecting mouse lymphocytes into rabbits. The serum had an immunodepressive effect on mice given injections of sheep erythrocytes: the formation of antibodies to the erythrocytes was sharply reduced. No immunodepressive effect of antilymphocyte serum was observed with respect to formation in mice of antibodies to the soluble polysaccharide Vi antigen of *S. typhi*, however. By saturating antilymphocyte serum 33-40% with $(\text{NH}_4)_2\text{SO}_4$, fractions were isolated from it whose immunodepressive effect considerably exceeded that of the initial serum. These fractions consisted 1/2

USSR

KRASKINA, N. A., et al, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, Vol 48, No 2, Feb 71, pp 83-89

of gamma-globulin (64-78%) and beta-globulin (22-36%). The effect of antilymphocyte serum in depressing the formation of antibodies to sheep erythrocytes could be assessed conveniently by determining the ED₅₀ of the serum, i.e., its mean dose in mg protein that reduced by 50% the number of antibody-producing cells in the spleen vs. the number of these cells in controls. The specific activity of antilymphocyte preparations with respect to their immunodepressive effect can be determined on the basis of the immunological response of mice to sheep erythrocytes by using these procedures.

"Frequency Sensor for Continuous Testing of Glass Fiber Thickness During Production"

Moscow, Steklo i Keramika, No 9, Sep 1970, Pages 16-18

Abstract: Methods currently used for testing the thickness of glass fiber are "passive," that is, performed after production and have low reliability. This article presents certain results from the investigation of a frequency method of testing the thickness of glass fiber during production. The method is based on the relationship between natural oscillating frequency of a drawn string and linear mass and tightness. An experimental model of a frequency sensor has been developed. Production tests of the sensor have confirmed its useability. The error does not exceed 4%, with 95% confidence. In the device, a vibrator forming one end support of the length of fiber drawn causes the fiber to oscillate, and the frequency of natural oscillations is measured by a photosensor.

"The Gezotayp D1"

Kiev, Mekhanizatsiya i Avtomatizatsiya Upravleniya № 2, Mar-Apr 73, pp 66-67.

Abstract: Leningrad University has developed a device (the Gezotayp D1) for manual input of information. The method of keying the information with the D1 has certain advantages over ordinary typewriter keyboard input: shorter training time for touch operation; smaller area of keying field with identical alphabet length; larger number of keyed characters with identical number of finger movements; possibility of touch operation using one finger. The keyboard for the 32 characters of the Russian alphabet has 6 contact points, four in one row and one on each side of the central row. Each of the switch positions can be deflected in either of two directions. A schematic diagram of the device is presented. It is stated that trained operators can input information at 800-900 characters per minute using the Gezotayp D1.

"Influence of the Immunodepressive Effect of Urethan on
Carcinogenesis in Pulmonary Isotransplants in Mice"

Minsk, Izvestiya Akademii Nauk BSSR, Seriya Biologicheskikh
Nauk, No 1, 1971, pp 112-113

Abstract Urethan in a dose of one milligram per gram of body weight (mg/g) was intraperitoneally administered to strain AF male mice 2-3 months old twice with an interval of 48 hours between injections. Seventy-two hours later, the animals were intraperitoneally immunized with doses of $100 \cdot 10^6$ of ram erythrocytes. The control mice were given only ram erythrocytes. Pulmonary tissue sections of intact mice and mice given urethan were used as transplants. Five months after the administration of urethan, the transplants were extracted from the animals, fixed in a 10% solution of formalin, stained with hematoxylin eosin, and examined. It was found that urethan has a pronounced immunodepressive effect, manifested by a 31% decrease in the

"Accuracy Of Amplitude Direction Finding By Phased Arrays"

Kiev, Izv. VUZ:Radioelektronika, Vol XVI, No 2, Feb '61, pp 29-37

Abstract: Allowing for the space-time fluctuations of the signal source, the error is determined of amplitude monopulse direction finding in approximation of "small" apertures and selection times. The results obtained in the particular case of an absence of signal fluctuations reduce to the results of a theory by L. E. Brennan (Zarubezhnaya radioelektronika [Foreign Radioelectronics], 1959, 1, 17). Cases of large and small regularity parameter and cases of direction finding with respect to a partially-coherent field are considered. The results of the work make it possible to calculate the component of the direction finding error due to signal fluctuations and noise for an effective functional scheme of treatment. 4 figs. 7 ref. "Effectiveness of New Compounds Against Sugar Beet Cercosporosis"

Moscow, Khimiya v sel'skom Khozyaystva, No 8, 1972, pp 36-37

Abstract: The development of cercosporosis and cercosporosis damage in sugar beets is described, and the results of testing new fungicides to control it are presented: brestane, triphenyltin acetate, benlate or benomyl [methyl-1-(butyl-carbamoyl)-2-benzimidazol carbamate], polycarbacon, polymarcin, maneb, and so on. Bordeaux mixture was used as the standard. When treating sugar beet plants against cercosporosis, benlate, brestane, polycarbacon, polymarcin and maneb can be used as substitutes for Bordeaux mixture. Double treatment of the sugar beets during the vegetation period by benlate and brestane in a concentration of 0.1% lowered the cercosporosis infestation of the plants by 3-4 times resulting in an increase in the yield by 34-37 cwt/hectare with an increase in sugar of 6.9-9.6 cwt/hectare.

"Electrochemical Corrosion of Iron-Graphite P/M Alloy and Ways of Combating It"

V sb. Treniys, smazka i iznos mashin (Friction, Lubrication and Wear of Machinery -- Collection of Works), Rostov-on-Don, 1970, pp 3-8 (from RZh-Metallurgiya, No 3, Mar 71, Abstract No 3G373 by S. Bobrova)

Translation: An investigation was made of iron-graphite alloy with 3% graphite having a density of $20 \pm 2\%$ after sintering on untreated specimens and on specimens protected by: 1) impregnation with urotropin inhibitor, 2) phosphate treatment, 3) impregnation with sodium benzoate, 4) nickel-phosphorus coating. A qualitative evaluation of the effectiveness of the protection employed was made by the method of comparing maximum corrosion currents in 0.5 n. NaCl solution. The maximum corrosion current ($8 \cdot 10^{-2}$ ma) is observed in the untreated specimens and declines successively from 1) to 4). The relative quantitative corrosion performance is determined by the gravimetric method in 0.5 n. NaCl solution at $22-24^\circ$ over a test period of 60 days. The most effective protective technique in this case is phosphate treatment. The porosity of the phosphate coating conduces to swifter penetration of the base metal by the corrosive

"Foot-and-Mouth Disease Virus in Ultrathin Sections"

Moscow, Veterinariya, № 1, Jan 71, pp 34-37

Abstract: Fetal pig kidney cells were inoculated with various dilutions of foot-and-mouth disease virus (A₂₂ strain) and cultured for 20 hours at 25°C, a temperature low enough to prevent lysis of the cell membranes and nuclei. Electron-microscopic study of thin sections made it possible to identify the viral particles from their internal structure, and to differentiate them from polysomes, free ribosomes and ribosomes bound to cisterns of the rough endoplasmic reticulum. The viral particles were mostly irregularly oval or angular. The most characteristic feature was the presence of nucleoids with well-defined contours. The nucleoids were generally angular or amoebiform and frequently formed rather long evaginations. A layer of fine-grained material surrounded the nucleoids. The viral particles were generally larger than in the control preparations made from normal cells.

Translation: A survey is made of the contemporary state of development of solid-state amplifiers and image converters, the operation of which is based on use of the phenomena of photoconductivity and electroluminescence of semiconductors. Existing designs are considered of image amplifiers based on powder layers, and their merits and shortcomings are analyzed. The prospects are shown for construction of solid-state image amplifiers based on thin-film elements. Thin-film solid-state image amplifiers are described which use electroluminescent films of ZnS:Eu deposited in a vacuum, and sintered [spetschennyj] photoconducting layers based on cadmium selenide. Such amplifiers have conversion ratios up to 100, a threshold of response of 10^{-3} lux and a limiting resolution of 25 line pairs [shtr.]/mm. 12 ill. 112 ref. Annotation.

"Deformation Characteristics of Titanium Alloys in Rolling"

Moscow, Tsvetnyye Metally, No. 7, Jul 71, pp 71-73

Abstract: The deformation process of titanium alloys was investigated by rolling composite and solid specimens of the alloys Vt1-1, Vt5, Vt8, Vt15, etc. The experiments revealed that the lower the plasticity and the higher the resistance to deformation of surface layers relative to central layers, the greater the widening of the rolled strip. For the calculation of the widening, formulas for the widening of steel strips with a certain correction can be used. A modified formula of A.I.Grishkov is presented from which the widening of titanium alloys can be calculated with a maximum discrepancy of 10 %. Three illustr., two formulas, one table, eight biblio. refs.

"Optimization of a Ship Course-Keeping System"

Leningrad, Sudostroyeniye, No 10, 1971, pp 40-42

Abstract: A mathematical simulation method is proposed for optimization of a ship course-keeping system. The control system and results of the simulation are depicted graphically. Use of a relay course-keeping system with one control input interval permits a decrease in the energy losses during maneuvering to be obtained by comparison with other relay systems. The proposed relay-course-keeping system has a great advantage as a result of simplification of the operating conditions of the steering system. Practical implementation of the developed system does not require significant changes in the existing course-keeping system especially since it can easily be made optimal with respect to speed. The investigated principle for constructing a course-keeping system for the maneuvering mode can also be used for the automatic course stabilization mode. Optimality of operation of the system is based on minimizing the following criterion:

$$J = \int_0^t |\Delta v| dt,$$

(from RZh:Elektronika i yeye primeneniye, No 2, Feb 72, Abstract No 2A478P)

Translation: A piezoelectric transducer is proposed which can be used in ultrasonic devices (defectoscopes, measures of velocity and attenuation of elastic waves) which are used for nondestructive quality inspection and determination of the physicomechanical properties of polymeric materials and products. The transducer contains an oscillator, an electrical delay line, a unit [elec] for division of the signal, and a piezoelectric vibrator. With the object of obtaining pulses with a duration equal to half of the oscillation period of the piezoelement, the piezoelectric vibrator is formed of three elements with equal acoustic resistance, the outside of which are piezoeactive and connected with outputs of the unit for division of signals; one output of the unit directly and the other across the electrical delay line connected to the output of the oscillator, and the central element serves as the mechanical half-wave delay line. The circuit of the transducer is presented. 1 ill. L.K.

KRASNIKOVA, R. D."Natural Vibrations of a Rod With Random Characteristics"

Sb. rabot aspirantov Dnepropetr. un-ta Mekh. i mat. (Collection of Works of Graduate Students of Dnepropetrovsk University, Mechanics and Mathematics), 1970, pp 119-124 (from RZh-Mekhanika, No 12, Dec 70, Abstract No 12V305, by I. Sh. Rakhmatullin)

Translation: The problem of the natural vibrations of an elastic, freely supported rod with random characteristics of stiffness $E\Gamma$ and mass is examined. These characteristics are assumed to be functions of a finite number of random parameters distributed according to the normal law with respect to some mean. It is assumed that the mean-square deviation of the random parameters is not large compared with the mean. The problem is solved by the perturbation theory method. Formulas are given for the first and second approximations of the correction to be applied to the natural frequencies and forms of vibrations of the rod. For the case when the perturbation is an increment of the per-unit-length mass of the rod δ_m , it is assumed to be in the form

$$\delta_m(x) = m f(x - x_0)$$

"Dependence of Mechanical Properties of EP56 (1Kh16N4B) Steel on the Quantity and Shape of Delta-Ferrite"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promyshlennost', No 1(79),
Jan/Feb 73, pp 39-40

Abstract: Rods (150 mm in diameter) made of steels produced by electric arc smelting (A), electroslag melting (B), and vacuum electric arc melting (C) were homogenized at 1150-1230°C for 15 hours. The quantity of delta-ferrite (areawise) in A, B, and C steels after homogenization was 0.4, 0.1, and 2.46-2.1, respectively, compared with 2.9-3.2, 2.45-3.0, and 6.7-10.2 before homogenization, respectively. A lower concentration of delta-ferrite in homogenized samples increased the impact toughness (two-fold) in a transverse direction with respect to the steel fibers. The ferrite particles were rounded and shaped like spheroids. The plastic properties and strength of the samples did not change much with a decreasing quantity of delta-ferrite, but the relative elongation across the fibers increased. The mechanical properties of the two melts are tabulated.

"Change of Delta-Ferrite in 1Kh16N4B Steel During Homogenization"

Moscow, Metallovedeniye, No 9, Sep 72, pp 66-67

Abstract: The effect of isothermal homogenization at 900-1300°C was studied to determine the amount and shape of the delta-ferrite formed in 1Kh16N4B cast steel (0.05% C, 0.28% Mn, 0.35% Si, 15.2% Cr, 3.6% Ni, 0.007% S, 0.025% P and 0.1% Nb). The investigation was conducted using blanks cut from a 780-kg commercial ingot produced at the Dneproprostssstal' Plant by vacuum arc remelting. It was found that between 900 and 1150°C the amount of delta-ferrite formed decreases with time. For instance, at 900°C, 14% delta-ferrite in the steel to start with ends up with only 12.5% after 30 hours at that temperature. The same process, decrease in amount of delta-ferrite with time at temperature, holds true up to 1150°C where 14% delta-ferrite is reduced to 6% after 30 hours. At 1200°C the decrease in amount of the delta-ferrite begins the same as for the other temperatures except that after 10 hours the quantity of delta-ferrite begins to increase from a low of about 7% up to 13.5% after 16 hours. The decrease in delta-ferrite followed by an increase after a few hours at

"Foam Materials Composed of Hollow Glass Microspheres and Polymeric Binders"

Moscow, Plasticheskiye Massy, No 3, 1970, pp 45-46

Abstract: Small hollow glass microspheres covered with EDS-6 or EDS-7 epoxy resin binder allowing thorough adhesion of all microspheres in one solid mass were developed as a water resistant foam material. The above resins are strong, water resisting cements, while other resins, such as EDS-5, contain hydroxyl groups and are hydrophyilic. The resin covered microspheres are very hydrostatic, even under considerable pressure. They can be used as gas containers and sound proofing material, and they can satisfy many aquatic needs.

A. I. Cherepanova, I. A. Shendrikova (Leningrad)

Summary

Rabbits, pigs, cows, chicken and ducks received during different periods of time (up to one year) fodder containing 3,4-benzpyrene. Animals and poultry were sacrificed 24 hours on termination of the experiment and their tissues and organs analyzed for the benzpyrene content. Meat and separately fat and in some instances also liver, blood, etc were, as a rule, taken for analysis. Milk of experimental cows was used for feedings calves, whose meat, liver and blood were then also subjected to examination. Investigations also covered milk of experimental cows and chicken eggs. Control assays were a common practice as well. Meat and other objects under examination either contained no 3,4-benzpyrene at all, or demonstrated merely its traces. Hence, the presence in fodder of relatively large amounts of benzpyrene does not cause this carcinogen to appear in animal food products. Studies were also made as to the amount of intact benzpyrene passed from the organism of rabbits, cows, calves and chicken.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE ABS. AGES OF VARIOUS PRECAMBRIAN MAGNETIC AND METAMORPHIC ROCKS WERE DETERMINED FROM ZIRCON BY THE ISOTOPIC METHOD. THE AGE DETERMINATIONS INDICATED THE PRESENCE OF 2 STAGES OF EFFUSIVE ROCK FORMATION IN THE BASHKIR ANTICLINAL (SOUTHERN URALS). THE ANCIENT TARATASHSK INTRUSIONS, WHICH TERMINATED THE LOWER PROTEROZOIC CYCLE AND WERE ACCCOMPANIED BY INTENSE REGIONAL METAMORPHISM, HAVE ABS. AGE OF 2000-200 MILLION YR. THE BERDYANSK PLUTON (1430 MILLION YR OLD) AND GUBENSK AND RYABINOVSK INTRUSIONS (1350 MILLION YR) BELONG TO SUCCESSIVE INTRUSIVE PHASE. THIS PHASE COINCIDED WITH LARGE INTERRUPTION IN SEDIMENT ACCUMULATION AND WAS DENOTED BY DISCONFORMITY BETWEEN THE BURZYANSK AND YURMATINSK SERIES INDICATING AN INTENSE DEVELOPMENT IN URALS OF THE STRATA HAVING A VERY LIMITED DISTRIBUTION IN THE EARTH. FACILITY: V. I. VERNADSKII INST. GEOCHEN. ANAL. CHEM., MOSCOW, USSR.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS STUDY THE APPLICATION OF THE ELECTRUTHERMAL ANALOGY METHOD FOR DETERMINING THE HEATING TEMPERATURE OF THE P,N,JUNCTION AND THERMAL RESISTANCE OF THE VKE, 300 SEMICONDUCTOR POWER RECTIFIER. THE ELECTRIC MODEL IS MADE FROM CONDUCTING PAPER. THE EGDA-9-60 ELECTROINTEGRATOR WAS USED FOR MEASURING. THE WORK PRESENTS A DETERMINATION OF THE SCALES OF ANALOGOUS TRANSFORMATION, THEIR INTERRELATIONSHIP, CALCULATION OF THE ELEMENTS OF THE MODEL ALONG WITH A DETERMINATION OF THE P,N,JUNCTION HEATING TEMPERATURE AND THERMAL RESISTANCE OF THE RECTIFIER UNDER THREE COOLING REGIMES. A COMPARISON OF THE DATA OBTAINED FROM THE MODEL WITH THE RESULTS OF THE FULL SCALE EXPERIMENT SHOWS GOOD AGREEMENT.

ABSTRACT/EXTRACT--(U) SP-0- ABSTRACT. DISCUSSION OF THE NONSTATIONARY PROBLEM OF THE IONIZATION OF A GAS CONTAINED IN GRAVITATIONAL EQUILIBRIUM AT CONSTANT TEMPERATURE IN THE UPPER HALF SPACE BY AN INSTANTANEOUS BURST OF RADIATION IN THE LOWER HALF SPACE. THE ANALYSIS IS PERFORMED FOR A GAS CONSISTING OF HYDROGEN ATOMS, UNDER THE ASSUMPTION THAT THE RADIATION PROPAGATING FROM THE LOWER HALF SPACE HAS A PLANCKIAN SPECTRUM AT A CERTAIN TEMPERATURE. THE HYDRODYNAMIC MOTION WHICH MAY ARISE DUE TO THERMAL EXPANSION IS NEGLECTED. A SOLUTION TO THE PROBLEM IS OBTAINED ON A DIGITAL COMPUTER. THE CHANGES IN THE DEGREE OF IONIZATION AND IN THE GAS TEMPERATURE ARE DETERMINED, TOGETHER WITH THE SPECTRAL COMPOSITION AND ANGULAR DISTRIBUTION OF THE RADIATION. THE GRAPHS OBTAINED INDICATE THAT THE IONIZATION PROCESS IS ESSENTIALLY NONEQUILIBRIUM AND THAT THE TIME REQUIRED FOR ESTABLISHING AN IONIZATION RECOMBINATION BALANCE DEPENDS ON THE GAS DENSITY, AND IS SHORTER FOR HIGH DENSITY LAYERS.

SYURIN, V. N., IVANOVA, G. A., KRASNORAYEV, Ye. A., and POMIN, Yu. V.

Laboratornaya diagnostika virusnykh bolezney zhivotnykh (Laboratory Diagnosis of Virus Diseases of Animals), Moscow, Kolos, 1972, 416 pp w/ill.

Annotation

Employing the latest advances by Soviet and foreign scientists the authors of the present book summarize the existing data on the diagnosis of virus diseases of animals.

In the description of a given disease a brief description of the agent is presented. Only those data that are essential for the identification of a virus and for the establishment of its etiological role in the onset of a disease are given.

The methods of taking, preparing and storing materials and the methods of growing viruses in large developing embryos, in primary and subinoculated cultures of cells from various animal tissues and organs, etc., are described in considerable detail.

Basic attention is devoted to the executing and reading of diagnostic reactions (complement fixation reaction, neutralisation reaction, agglutination inhibition reaction, etc.) and to the description of a method for conducting biological tests of receptive laboratory animals.
