"The Effect of Arid Zone Conditions (Turkmenia) on the Functional State of the  
Adrenal Cortex of Healthy Persons"

Moscow, Problemy Endokrinologii, Vol. 16, No 4, Jul/Aug 70, pp 40-44

**Abstract:** Urinary excretion of 17-hydroxycorticosteroids and 17-ketosteroids was determined in 10 healthy persons who had resided in areas of moderate climate and were called to military service in the southern region of Turkmenia. Ten additional healthy subjects who had lived in the middle zone and were called to military service in their native area served as controls. No significant differences were noted between the two groups in the basal level of 17-hydroxycorticosteroid or 17-ketosteroid excretion. In persons living in hot climate for 3, 6, and 15 months however, a statistically significant reduction of 17-hydroxycorticosteroid and 17-ketosteroid excretion was noted in response to the administration of ACTH.

"The Influence of Walls on the Lifting Force of the Wing of a Solid Profile"

Kazan', Izvestiya Vysshikh Uchebnykh Zavedeniy, Aviatsionnaya Tekhnika, No 2, 1973, pp 29-33

**Abstract:** A study was made of the influence of walls of a plane channel on the lifting force of the wing of solid profile. The solution of the problem is found with the aid of methods of the potential of accelerations and the asymptotic method of functional parameters. From plotted curves characterizing the change of the function of the influence  $\psi_{scy}/c_{sy}$  for various profile-wall distances, the influence of walls on the lifting force of a wing of given geometry can be evaluated. The essential influence of walls on the wing lifting force is demonstrated on an example and the analysis of derived graphs of  $\psi$  changes. The figures, sixteen formulas, seven bibliographic references.

Mat. fizika. Resp. mezhved. s). (Mathematical Physics. Republic Interdepartmental collection), 1970, vyp 8, pp 102-107 (from Uch-Matematika, No 5, May 71, Abstract No 5B477)

Translation: The problem of motion of a wing of solid profile close to a screen is solved by using the acceleration potential method. The solution of the singular integral equation of the problem is found by an approximation method using a small parameter. As a result, a formula is derived for a wing profile and used for calculation in a specific instance. Author's abstract.

"Photovoltaic Cells Made From Silicon Crystals With Special Cross Sec-  
tional Shapes Grown by the Stepanov Method"

Moscow, Izv. AN SSSR: Ser. Fizicheskaya, Vol 36, No 3, Mar 72, pp 522-524

**Abstract:** A previously described method (Artyshevskiy, P. P. et al., Izv. AN SSSR: Ser. Fiz., Vol 36, 1972, p 525) was used for growing noncylindri-  
drical silicon crystals to be tested in solar batteries. Polycrystal and  
single crystal specimens of  $p-n-p$  structure with resistivity ranging from  
0.1 to 15 ohm-cm were grown, cut, tritatively into thin plates, and polished  
on one face. The  $p-n$  junction was made by phosphorus diffusion. The  
finished cells had an area of 0.2-1.2 sq. cm. Cells made from polycrystalline  
had higher efficiency than monocrystalline cells. The sheet resistance of  
the polycrystalline cells was showing high purity of the semiconductor  
material. The low sheet resistivities of cells made from single crystals  
were not far from an order of the polycrystal cells, which is attributed

FYSHEVSKIY, P. P. et al., IAN SSSR: Ser. Fiz., V 35, 1972, pp 522-524

in the low purity of the single crystal material as evidenced by low shunt resistance. This same index shows that contamination is a random factor rather than being due to the method of crystal growing. On the whole, the results show that photovoltaic cells made from noncylindrical crystal rods are at least as good as cells made from Czochralski crystals.

"Particulars on the Thermal Expansion of Graphite-Metal Soldered Joints"

Moscow, Svarochnoye Proizvodstvo, No 6, Jun 73, pp 36-37

**Abstract:** The authors study the thermal expansion of specimens in the 20-500°C interval. Soldered specimens made from GM3 graphite and St3 steel were used. These were soldered at 1155°C at a heating rate of 575 and 400°C/minute. The study was carried out in the Shevenara (DR-49) horizontal quartz dilatometer. The maximum measurement error for the average linear coefficient of thermal expansion was  $+0.2 \cdot 10^{-6} \text{ 1}/\text{0}^{\circ}\text{C}$ . Cylindrical specimens 3.5mm in diameter and 40mm long were used for measurement purposes. X-ray quality control shows that the specimens differ with respect to each other according to the depth of metal penetration into the graphite, and with respect to the nature of the distribution of the metallic inclusions in the transition zone of the joint. The results show that the coefficient of thermal expansion for the graphite-steel soldered specimens exceeds the index by seven percent, where the index is obtained by the computational method from the conditions for the additivity of the thermal expansion of carbon and steel. An evaluation of the thermal expansion of the zone of soldering shows that the coefficient of thermal expansion is determined by the depth and nature

"Interaction of Refractory Oxides with Graphite In Spraying"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 3, May-Jun 72, pp 94-99

**Abstract:** The interaction of refractory oxides with graphite in flame spraying was investigated in order to develop protective means against oxidation of carbographitic materials. The investigated dependences included the effect of base preheating on the bonding strength with the protective coatings and its density, effects of silicate and borosilicate sublayers on the bonding strength and the activation energy of the chemical interaction of sublayers with oxide coatings, the effect of graphite porosity on the bonding strength, and the effect of addition of molybdenum, silicon, and aluminum into the sprayed oxide on the gas density and the oxidative resistance of coatings. The kinetics of the increasing bond strength of  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  coatings

sprayed on preheated graphite are analyzed. The required activation energy of the graphite surface and its strong bond with the sprayed  $\text{Al}_2\text{O}_3$  was found to be close to the half of the energy of the atomic bond in the graphite lattice,

USSR

GALKIN, YU. A., et al., Fizika i Khimiya Obrabotki Materialov, No 3, May-Jun 72, pp 94-99

which is in accordance with the graphite preheating over 1000°C when spraying. Silicate and borosilicate sublayers are recommended; they guarantee a bond strength of coatings on the level of graphite strength. Five illustrations, one table, three bibliographic references.

"Optimization of the Processes of Obtaining Spherical Zirconium Powder by Plasma  
Atomization of Wire using Mathematical Statistics"

Tr. Mosk. aviat. in-ta (Works of Moscow Aviation Institute), 1971, vyp. 228,  
PP 130-138 (from RZh-Metallurgiya, No 4, Apr 72, Abstract No 46401)

Translation: The optimal conditions of plasma atomization of Zr-wire to obtain spherical powder with a particle size of 400-800 microns sufficiently pure with respect to N<sub>2</sub> and O<sub>2</sub> (with a granule microhardness  $\leq 300\text{-}500 \text{ kg/mm}^2$ ) are defined. When processing the experimental data, the ranging method was used. A vacuum plasma atomization device was designed and manufactured for obtaining spherical powders of chemically active refractory metals. The optimal conditions of the Zr atomization process are as follows: current  $500 \pm 60$  amps, argon flow rate  $3.2 \text{ m}^3/\text{hour}$ , rarefaction in the chamber  $400 \text{ mm Hg}$ , spacing between the wire and the nozzle section  $0.5 \text{ mm}$ . The yield of the Zr powder fraction 400-800 microns in size is 60%. 5 illustrations, 3 tables, and a 13-entry bibliography.

"Effect of the Environment on the Composition and Microstructure of Spherical Refractory Metal Powder Obtained by the Plasma Atomization Method"

Tr. Mosk. aviats. in-ta (Works of Moscow Aviation Institute), 1971, vyp. 22S,  
pp 139-148 (from Izv--Metallurgiya, No 4, Apr 72, Abstract No 4G400)

Translation: The environment has a noticeable effect on the composition and microstructure of powders obtained by plasma atomization. The Zr powders, the composition of which is similar to the composition of the initial wire, can be obtained by atomization of the Zr in a chamber filled with Ar with cooling of the powder particles in spindle oil. When combining atomization with chemical-heat treatment of the granule during the atomization process, it is possible to obtain Zr granules coated with a film of  $ZrO_2$  (when atomizing in the air and cooling the granules in water). It is also possible to obtain carbide granules or granules with a surface carbide film when atomizing Mo and Zr in hydrocarbon vapors and cooling the granules in transformer oil. In order to obtain pure spherical Mo powder, it is recommended that the atomization take place in Ar and the granules be cooled in water. Six illustrations and a 5-entry bibliography.

DERGUNOVA, V. S. (Candidate of Technical Sciences)

"High-Temperature Strength of Joints of Graphite Materials"

Moscow, Svarochnoye proizvodstvo, No 1, Jan 72, pp 13-19

**Abstract:** Discussed is a method of joining graphite materials by the use of an intermediate carbide-forming interlayer. It is shown that the high-temperature strength of the brazed joint is a function of the interaction of the molten solder with the graphite, the depth of its penetration in the pores of the material, the newly formed phase composition, and the strength of the graphite. Comparison tests on graphite specimens bonded by a zirconium interlayer indicate that the strength of the brazed specimens heated above the melting temperature of zirconium is 30 to 35% higher than that of specimens heated below this temperature. The tensile strength of the brazed joints increases with the penetration depth of the solder up to a specific value (2-2.5 mm) and then remains constant. The failure which had occurred in the specimens in tensile tests at 200°C was found to be

1/2

USSR

ANIKIN, L. T. (Candidate of Technical Sciences), et al., Sverochnye proizvodstvo, No 1, Jan 72, pp 18-19

along the graphite outside the brazing zone. It is suggested that brazing of large-pore graphite be done with solders capable of forming (on contact) carbon saturated fusions under compression to afford maximum solder penetration and complete carburization to a composition close to stoichiometric. The study includes test data on solders from hafnium, molybdenum, and tungsten. (5 illustrations, 9 bibliographic references).

"Joining Graphite With Graphite and Metal by Electric-Arc Welding"

Moscow, Tsvetnyye Metally, No 7, Jul 71, pp 44-47

**Abstract:** A method of joining graphite parts with graphite and metallic parts by means of a metallic interlayer deposited on the surface of the graphite part by the electric-arc welding practice is discussed. The following materials with a mean linear expansion coefficient with respect to graphite and metal were investigated for their utilization as interlayers: V, Ti, Mo, W, Zr, Nb, and Kovar. It was found that Ti and Zr are the most promising interlayer materials. The use of Kovar as an interlayer material is recommended for welding graphite with stainless steel and other steel types. Three illustrations, three tables, six bibliog. refs.

"Age-Associated Changes in the Concentration of SH-Groups in the Cortical  
Section of the Visual Analyzer in Some Mammal"

Doklady Akademii Nauk BSSR, Vol 14, No 12, 1970, pp 1,138-1,139

Translation: It is known that many substances present in the mammalian body contain SH-groups. Among these substances are proteins, enzymes, some co-enzymes, and low-molecular-weight compounds such as cysteine, homocysteine, eogothioneine, and others. They participate in such important physiological processes as muscular contraction, tissue growth and regeneration, and nervous excitation and inhibition (1-4).

The literature contains scanty data on age-associated shifts in the concentration of SH-groups and the information is contradictory. These investigations were done by various methods with unequal specificity and sensitivity.

Some investigators have demonstrated that in advanced senility, the concentration of SH-groups in the proteins of the cerebral cortex, liver, kidneys, skeletal muscles, and heart of guinea pigs and rats decreased. Other

USSR

BORTNIK, E. M., et al., Doklady Akademii Nauk SSSR, Vol 24, No 12, 1970,  
pp 1,138-1,139

researchers have found that the concentration of SH-groups in the cerebrum was greater in old rats than in young rats. However, age-associated shifts in the concentration of SH-groups in different tissues proceed at a different rate as a result of the fact that the process of aging is heterochromous. In view of the importance of SH-groups in oxidative phosphorylation, we became interested in investigating the concentration of SH-groups in the cortical section of the visual analyzer (field 17). As experimental subjects we used newborn dogs, 1 and 6 months old, and 2 and 18 years old as well as newborn rats and 1, 6, 14, and 32-month-old rats. Tissues were fixed in a 1% solution of trichloroacetic acid in 80% alcohol. Protein-bound SH-groups were determined by the method of Barnet and Zeligman.

The concentration of SH-groups was analyzed in the following segments of neurons: cytoplasm, cytoplasmic membrane, processes, nuclear membrane, and nucleolus.

The highest concentration of SH-groups was observed in neurons and surrounding structures in the fourth layer. A smaller concentration of SH-groups was found in the cytoplasm of nerve cell bodies in the subcortical area.

- 68 -

USSR

BORTNIK, E. N., et al., Doklady Akademii Nauk BSSR, Vol 14, No 12, 1970,  
pp 1,138-1,139

third layers, while the concentration in the star-shaped cells in the fifth layer was greater. Nuclear and cytoplasmic membranes and nucleoli had the highest concentration of SH-groups. The karyoplasm was found to be relatively poor in this substance.

Within one layer, neurites and dendrites had approximately the same concentration of SH-groups.

Investigation of the SH-groups in correlation with age showed that the distribution of SH-groups in the neurons and their processes was different in animals of different ages. The concentration of SH-groups in newborn animals was fairly high, increased at the age of 6 months, was highest in rats aged 14 months and in dogs aged 2 years, and then gradually decreased. Rats aged 32 months and dogs aged 18 years had a small concentration of SH-groups in the neurons and in the surrounding structures. Of special interest was the following observation: the decrease with advancing age proceeded in the reverse order than the previous increase.

Analyses performed on young embryos, newborn animals, and those aged 1 month, 6 months, and more revealed that the SH-groups accumulated first in nuclear and cytoplasmic membranes and then in nucleoli, cytoplasm, and

USSR

BORTNIK, E. M., et al., Doklady Akademii Nauk BSSR, Vol 14, No 12, 1970,  
pp 1,138-1,139

karyoplasm. During aging, the concentration decreased first in the karyoplasm, then in the nucleoli, and finally in the nuclear and cytoplasmic membranes.

Thus, this study has revealed that with advancing age, shifts take place in the concentration of SH-groups in the cortical segments of the visual analyser in rats and dogs. The concentration of SH-groups in neurons is high in newborn animals, reaches a peak in rats aged 14 months and in dogs aged 2 years, and considerably decreases in senility.

The speed of protein regeneration in ontogenesis decreases with advancing age. One of the reasons may be the decreasing concentration of SH-groups in the tissue.

mapping is selected, for which the system of corresponding ellipses (lines of equal pressure) is converted to a system of concentric circles, and the piezoconductivity equation is converted to a system of coordinates in which the variables are the radii of these circles  $r$  and the central angles  $\phi$ .

An approximate method is presented for solving these equations; the solution is sought in the form  $P(r, \phi, t) = \bar{P}(r, t)F(\phi)$ , where  $\bar{P}$  is the mean pressure along the ellipse, and the problem is thus reduced to solution of the equation for variables  $r$  and  $t$ . The author notes that the results of numerical solution of the precise equation and the approximate equations produced give satisfactory agreement, and also studies the problem of the possibility of replacement of the elliptical area of filtration with a circular area (in order to simplify calculation).

"Some Characteristics of a Continuous, Solid-State Ring Laser"

Leningrad, Optika i Spektroskopiya, No 4, October 1973, pp 775-776

**Abstract:** This brief communication gives the results of experiments performed to obtain the characteristics of a solid-state ring laser. It is shown that under specific conditions, there is an instability in the two counter waves. The laser used in the experiments contained a YAG-neodymium crystal and operated at a wavelength of  $1.06\mu$ , with an oscillation threshold of 500 w, and at  $1.3\mu$ , with an oscillation threshold of 1200 w. The laser resonator was formed by three mirrors with radii of curvature of 5000 mm, 2000 mm, and infinity and reflection factors of about 99% at the oscillation wavelength. A garnet crystal with a diameter of five mm and a length of 50 mm, with plane-parallel terminations, was the active element, and the resonator was 117 cm long. The type of oscillation was investigated as a function of the coupling coefficient of the counter waves. Oscillograms of the laser output are given.

"Injection of a Short Light Pulse Into a Laser With a Long Cavity"

Moscow, Doklady Akademii Nauk SSSR, Vol 209, No 4, 1 Apr 73, pp 826-828

**Abstract:** The authors discuss certain effects which arise when a short pulse of light is injected into a cavity with a transit time much greater than the pulse duration. Two injection modes are considered. If emission has already taken place in the laser before arrival of the external pulse, a mode of competitive interaction between the short pulse and the "laser" emission of the laser takes place. In the second case, injection takes place before emission has developed. Conditions are discussed which lead to a quasistationary "traveling" pulse mode under the action of an external pulse. It is experimentally shown that the duration of emission in the traveling pulse mode is greater than in the mode of free emission. The envelope of the emission pulse train approximates the shape of the pumping pulse. Other modes of emission are to be treated in future papers.

"Structure of the Oscillation Pulses of a Laser With Linear Delay Inside the Resonator"

Moscow, Radiotekhnika i elektronika, No 8, 1972, pp 1760-1762

**Abstract:** Lasers with linear delay inside the resonator may have as much as one hundred simultaneously generating modes when the effective length of the resonator is in the tens of meters. Experiments are described in this paper aimed at determining the characteristics of the "fine" radiation pulses caused by the presence of so many different types of modes. A description of the equipment, including a diagram, is given, and an oscillogram of the radiation pulses clearly indicating their fine structure. Formulas are given for the intensity of the radiation field in multimode radiation and for the distribution probability of the radiation amplitude fluctuations. The length of the resonator used in the experiment was 60 m.

Published by the Academy of Sciences USSR, Ministry of Instrument Construction, Automation Techniques and Control Systems, Order of Lenin Institute of Control Problems (Automation and Remote Control), Printed by "Nauka" Publishing House, Moscow

Extract: The authors attempt to demonstrate the enormous potentialities of optical electronics in information technology, to systematize the various methods of constructing optoelectronic devices, and to classify them.

Many problems in optoelectronics have not been adequately covered in this book; a number have merely been stated, while others have been ignored. The authors attempted not so much to treat exhaustively all possible optoelectronic elements in information systems and their design principles, but to interest the reader in the new trends in modern science and to focus attention on the great promises it represents.

"Modulation Method for Measuring the Speed of Light"

Minsk, Zhurnal Prikladnoy Spektroskopii (Journal of Applied Spectroscopy),  
Vol 12, No 2, Feb 1970, pp 339-340

Abstract: A laser method is proposed for more exact measurement of the speed of light. The apparatus consists of a laser, optical modulator, Fabry-Perot interferometer, an optical system with a diaphragm, photodetector, measuring circuit, and an oscillator.

The laser beam passes through the optical modulator and interferometer, which produces interference rings that are recorded by the photodetector. The side frequencies of the main beam are shifted by the frequency of the optical modulator, and these frequencies produce additional interference rings at the output of the interferometer.

By adjustment of the modulation frequency, the interferometer becomes transparent in a given direction for two frequencies, and two orders of 1/2

"Single-Frequency Ruby Ring Laser"  
Moscow, Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 58, No  
2, Feb 70, pp 541-543

Abstract: The authors' purpose was to obtain a single mode for a traveling-wave ruby ring laser from the very start of generation, as well as to measure the width of the radiation frequency shift during generation of such a laser in a single mode. It is shown that the radiation sequence of a small number of spikes (usually 1-5 spikes) with a repetition interval of the order of 30 microseconds. The temperature drift of the radiation frequency during generation is small (less than 7 Mc).

ABSTRACT/EXTRACT--(U) GP-C ABSTRACT. A LASER METHOD IS PROPOSED FOR  
MORE EXACT MEASUREMENT OF THE SPEED OF LIGHT. THE APPARATUS CONSISTS OF  
A LASER, OPTICAL MODULATOR, FABRY PEROT INTERFEROMETER, AN OPTICAL  
SYSTEM WITH A DIAPHRAGM, PHOTODETECTOR, MEASURING CIRCUIT, AND AN  
OSCILLATOR. THE LASER BEAM PASSES THROUGH THE OPTICAL MODULATOR AND  
INTERFEROMETER, WHICH PRODUCES INTERFERENCE RINGS THAT ARE RECORDED BY  
THE PHOTODETECTOR. THE SIDE FREQUENCIES OF THE MAIN BEAM ARE SHIFTED BY  
THE FREQUENCY OF THE OPTICAL MODULATOR, AND THESE FREQUENCIES PRODUCE  
ADDITIONAL INTERFERENCE RINGS AT THE OUTPUT OF THE INTERFEROMETER. BY  
ADJUSTMENT OF THE MODULATION FREQUENCY, THE INTERFEROMETER BECOMES  
TRANSPARENT IN A GIVEN DIRECTION FOR TWO FREQUENCIES, AND TWO ORDERS OF  
FREQUENCY CAN THEN BE SUPERIMPOSED. AN EQUATION IS GIVEN FOR  
CALCULATING THE SPEED OF LIGHT TO WITHIN AN ERROR OF 10 NEGATIVE PRIME7.

UNCLASSIFIED

USSR

SHVETSKIY, et al., USSR Author's Certificate No 347909 K1h 03 K 13/20, filed  
9 Aug 68, published 4 Sep 72

The outputs of the discharge and transfer instruction shaper are connected respectively to the apparatus memory discharge bus and the apparatus transfer bus; the sign flipflop is connected to the output of the high-order position of the counter, and its output is connected to one of the inputs of the phase-sensitive detector and to the control input of the transfer apparatus.

To reduce conversion error, the discharge and transfer instruction shaper contains flipflops, an inverter, and coincidence circuit. One set of flipflop inputs is connected to the output of the frequency divider; the other flipflop inputs (except for the first) are connected to the output of the cyclic pulse generator.

The input of the first flipflop is connected to the output of the zero unit; the direct output of the second and the inverted output of the third flipflop are connected to one coincidence circuit, to which the direct output of the sign flipflop and the output of the cyclic pulse generator are also connected. The direct output of the third and the inverted output of the fourth flipflops are connected to the other coincidence circuit, to which the inverted output of the sign flipflop and the output of the cyclic pulse generator are also connected; the outputs of the coincidence circuits are connected through an inverter to the transfer bus. Three illustrations.

"Electrophoretic Precipitation of the Suspensions of Electroluminophores"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 46, No 4, Apr 73, pp 796-800

**Abstract:** The process of electrophoretic precipitation of electroluminophores from suspensions, and their behavior in electric field was studied in order to determine basic laws of the formation of electroluminescent panels (ELP). To obtain desired ELP by the electrophoretic method, it is necessary to use a luminophore with uniform distribution of the activator's concentration among its particles, or the direction of the electric field and the concentration of the suspensions have to be selected so that they would fall in the range of the aggregation of particles. The brightness of the ELP obtained in this fashion should exceed the brightness of the panels obtained by the pulverization method.

"A Device for Computing Aerodynamic Parameters"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Novarynyye Znaki, No  
23, 1970, Author's Certificate No 276528, Filed 28 May 69

Abstract: This Author's Certificate introduces a device for computing aerodynamic parameters such as altitude, velocity, and Mach number. The unit contains converters of primary information to binary code which are connected through a shift register and adder to the input of an arithmetic device. Also included in the computer are a memory unit, decoder, pulse generator, control device, and recording unit. As a distinguishing feature of the patent, the electrical circuit is simplified and the overall dimensions are reduced by connecting the most significant digital places of one of the registers in the arithmetic device to the least significant digital places of the address section of the command register in the control unit through diodes controlled by the decoder and the pulse generator. The most significant digital places of the address section and the code section of the command register in the control device are connected to the memory unit.

117166m Nature of the metal complexes participating in the electrochemical step [of reversible reactions]. Kravtsov, V. I. (Leningrad. Gos. Univ. im. Zhdanova, Leningrad, USSR). Elektrokhimiya 1970, 6(2), 275-7 (Russ). The nature of the complex participating in the electrochem. stage is studied, from the effect of the electrode material on the kinetic characteristics of this stage. In the case of an inner-spherical mechanism the characteristics should depend to a larger extent on the electrode material than with an extra-spherical mechanism. The nature of adsorption of the reacting particles can be inferred from the cor. Tafel dependences obtained for various background concns. and various electrodes. These dependences found for the elec. redn. of  $\text{Fe}(\text{CN})_6^{4-}$  on Hg, Ta, and In amalgams points to the absence of a specific adsorption of the resulting complex at high neg. electrode potentials, thus to an extra-spherical mechanism. The redn. of  $\text{PtCl}_6^{2-}$  on a Hg cathode proceeds by the inner-spherical mechanism. The redn. of chloride cor. layers of bivalent Pd (on Pd and Hg dropping electrodes) is preceded by the splitting-off of two  $\text{Cl}^-$  ions from the  $\text{PdCl}_6^{2-}$  complexes prevailing in the soln. Since near the equil. potential of the Pd/PdCl<sub>6</sub><sup>2-</sup> system the reaction rate of Pd(II)

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, 1970, No 36, Soviet Patent No 288036, class 21, filed 22 Apr 68, published 3 Dec 70, p 54

Translation: This Author's Certificate introduces a magnetic pulse-duration modulator for controlling transistorized amplifiers. The unit contains a choke-type magnetic amplifier and controlled transistors. As a distinguishing feature of the patent, in order to increase the sensitivity of the magnetic amplifier as well as to reduce the dimensions of its core, two tunnel diodes connected in series-opposition are placed in series with the magnetic amplifier windings. The common point of these diodes is connected to the emitters of the transistors, while the anodes of the diodes are connected to the bases of the transistors.

"The Effects of Chlorpromazine and Tizercine on the Permeability of the Hematoencephalic Barrier Under Normal Conditions and in Experimental Inflammation"

Moscow, Farmakologiya i Toksikologiya, Vol 35, No 1, Jan/Feb 72, pp 55-60

Abstract: The effects of the neuroleptics chlorpromazine and tizercine on the permeability of the hematoencephalic barrier under normal conditions and in experimental inflammation produced by a subcutaneous injection of a mustard suspension in sterile sunflower seed oil were studied in experiments on rats. <sup>131</sup>I-albumin derived from human serum albumin and uranine (Na-fluorescein) were used as tracers to determine the permeability of the barrier. The neuroleptics were administered in doses of 1 and 5 mg/kg. After a single administration of either neuroleptic, the permeability for <sup>131</sup>I-albumin increased. That for uranine decreased after a single administration of chlorpromazine and remained unchanged after a single administration of tizercine. On repeated administration of these drugs, the effect produced by them changed in a direction that

USSR

KOMENDANTOVA, M. V., et al., Farmakologiya i Toksikologiya, Vol 35, No 1, Jan/Feb 72, pp 55-60

could be opposite to that produced by a single administration and that varied depending on the dose of the drugs. In experiments on the animals with inflammation, either drug produced a shift in the permeability to  $^{131}\text{I}$ -albumin opposite to that produced by the inflammation - i.e., the drugs corrected the disturbances in the permeability of the hematoencephalic barrier that were due to the inflammation.

"Effect of Phase Composition on the Properties of Austenitic Chromium-Nickel Steels in Castings and Welded Parts"

Liteyn. proiz-vn (Casting Production), 1970, No 11, pp. 29-30 (from EZh-Metalurgiya, No 4, Apr 71, Abstract No 4I649)

Translation: A study is made of EI572 heat-resistant steel containing (in %) C 0.28-0.33, Mn 1.08-1.27, Si 0.60-0.80, Cr 18.20-20, Ni 8.1-9.7, W 1.48-1.50, Mo 1.20-1.35, Ti 0.22-0.78, Nb 0.26-0.50. The castings were austenitized at 1,160°, and they were cooled in water before aging at 650-820° for 15 hours. The δ-ferrite content in the samples was determined after austenitization and aging. Increasing the Cr, Ni, and Ti content increases the δ-ferrite content. With an increase in the content of C > 0.30%, the amount of  $\gamma_2$  carbides

increased along the grain boundaries. The cooling rate of the casting has a noticeable effect on the amount of δ-ferrite in the steel: in the case of accelerated cooling of the casting in water (4°/second) the amount of δ-ferrite was about twice that obtained with ordinary cooling in the air (0.15°/second). Castings made of EI572 steel for welding must contain 3-2.1/2

УССР

SPASSKIY, V. V., et al., Liteyn. proiz-vo, 1970, No 11, pp 19-30

$\delta$ -ferrite. This is somewhat higher than for the same steel during hot working. The required amount of  $\delta$ -ferrite is insured by a 0.3-0.45% Ti content in steel.

"Wide-Band Transistorized Power Amplifiers in the Meter Range"

Moscow, Pribory i Tekhnika Eksperimenta, No 6, 1971, pp. 100-102

**Abstract:** Two versions of transistorized amplifiers with wide-band matching circuits executed on the basis of filter circuits assembled with common base and emitter are presented. They have Chebyshev characteristics. A schematic is presented of an amplifier operating in the frequency range of 95-155 megahertz and assembled from three transistors with parameters analogous to the 2N3375 transistor with a common base. The output circuit of the amplifier matching the output impedance of the third cascade with a 50 ohm load was made three-element and insures a load resistance for the output transistor of 30 ohms. The overall dimensions of this amplifier are  $140 \times 30 \times 20 \text{ mm}^3$ . The mean output power in the operating range is 3.2 watts, and the power amplification coefficient  $K_p \sim 23$  decibels.

The second version of the amplifier for the 220-290 megahertz range was assembled from two transistors analogous to the 2N3632 with a common emitter. The input and intercascade circuits are two-element to match the input impedance of the transistor with the generator and the output impedance of the transistor. The intercascade matching circuit insures a load resistance for transistor. The intercascade matching circuit insures a load resistance for transistor.

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 8, Aug 71,  
pp 1736-1740

Abstract: The article shows that the imidazolide method can be extended to dicarboxylic amino acid derivatives and used for the synthesis of  $\alpha$ -aspartyl ester of adenosine-5'-phosphate as a result of the reaction of the imidazole of  $\beta$ -tert.-butyl ester of N-tert.-butylhydroxycarbonyl-aspartic acid with pA. The structure of the resultant compound was confirmed by hydrolysis and ammonolysis. The stability of the compound in aqueous solutions at various pH values was determined.

The Feasibility of Using Diethyl Phosphate Imidazolide for the Synthesis of  
3'-(2')-O-Aminoacyl Nucleotides"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 8, Aug 71, pp  
1730-1736

**Abstract:** In the search for imidazole compounds which react in an aqueous medium with carboxylic acids to give their imidazolides, the authors studied the interaction of diethyl phosphate imidazolide with acetic acid and tert.-butylhydroxycarbonyl alanine in an aqueous medium and in absolute isopropanol. It was found spectrophotometrically that the corresponding imidazolides are formed. It is shown that it is possible in principle to use diethyl phosphate imidazolide as activating agent for the synthesis of 3'-(2')-aminoacyl nucleotides as a result of the reaction between amino acid and nucleotide in an aqueous medium, but that this reactant is not effective enough, since the rate of its hydrolysis is of the same order as the rate of N-acylimidazole hydrolysis.

5'-triphosphates"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 6,  
Jun 70, pp 1369-1372

Abstract: It was shown that the synthesis method for O-aminoacyl derivatives of nucleotides and nucleoside triphosphates could be extended to the preparation of 3'-(2')-O-peptidyl-nucleoside-5'-triphosphates. N,N'-carbonyldiimidazole (11.6 mg) was added to a solution of 13.2 mg of BOC-Ala-AlaOH in 0.1 ml of DMFA, stirred for 5-10 min at 20-22°, and the imidazolide formed was added to a solution of about 0.018 mmole of the nucleoside-5'-triphosphate in 0.5 ml water (adenosine- or guanosine-5'-triphosphate). The reaction mixture was stirred for 3.5 hrs at 20-22°, and paper chromatographed, the product was eluted at 4° and lyophilized. In a similar manner

KRAYKO, A. N., TILLYAYEVA, Moscow"Construction of the Minimum Wave Drag Outline in a Nonuniform Supersonic Flow"

Moscow, Prikladnaya Matematika i Mekhanika, Vol 37, No 3, 1973, pp 469-487

**Abstract:** A study was made of the variation problem of the construction of the generatrix of a flat or axisymmetric body insuring minimum wave drag when there is flow by a nonuniform (nonisoentropic and nonisoenergetic) supersonic flow of an ideal (nonviscous and nonthermally conducting) gas in the case where a zone of sharp variation of the parameters retained (in the absence of discontinuities) along the current line, that is, the entropy and total enthalpy, falls in the region of definition of the desired outline. At the limit, the indicated zone degenerates into a tangential discontinuity. The investigation is limited to configurations (for example, nozzles or the afterbodies), for which there are no shock waves (including the bow shock) in the investigated region. The known solution [Yu. D. Shmyglevskiy, Nekotorye variatsionnye zadachi gazovoy dinamiki, M., Tr. VTs AN SSSR, 1963; A. N. Krayko, Variatsionnye zadachi sverkhzvukovykh techeniy gaza s prizvol'nyim termodynamicheskim svyaziem, M., Tr. VTs AN SSSR, 1963] obtained previously for nonuniform flows and giving a smooth (without internal breakpoints) optimal outline can not in such cases be realized and must be replaced by the solution for which the generatrix of

1/2

USSR

KRAYKO, A. N., ET AL., *Prikladnaya Matematika i Mekhanika*, Vol 37, No 3, 1973,  
pp 469-487

the optimal body contains no less than one internal breakpoint. Since the configurations of this type can not be investigated using the transition used in the above-cited papers to the control outline, in order to obtain the necessary conditions of the extremum defining the shape of the optimal generatrix it is necessary to use the general method of Lagrange factors in the previously developed form [K. G. Guderley, et al., *Teoriya optimal'nykh aerodinamicheskikh form.*, Moscow, Mir, 172-194, 1969; A. N. Krayko, *PMN*, Vol 28, No 2, 285-295, 1964; Vol 30, No 2, 312-320, 1966]. On the basis of the optimality conditions obtained, a numerical algorithm is developed and examples of the optimal generatrices of flat bodies are constructed in the case of a flow with a tangential discontinuity.

"Investigation of the Reflection of Disturbances From the Subsonic Part of the Laval Nozzle"

Moscow, Izvestiya Akademii Nauk USSR, Mekhanika Zhidkosti i Gaza,  
No 1, Jan-Feb 73, pp 84-93

**Abstract:** The problem of the reflection of longitudinal disturbances from subsonic and transonic parts of the Laval nozzle is investigated. It is assumed that the nozzle is next to the cylindrical tube and that the incoming disturbance is a plane harmonic Riemann wave. The numerical integration of proximate equations of axisymmetric transitional flow of an ideal nonviscous and nonheat-conducting gas is used for solving the problem. This method makes it possible to rate the influence of nonlinear effects as well of effects of the two-dimensionality of the flow. The results are compared with outcomes of calculations carried out in conformity with

the well-known theory of H. S. Tsien, L. Crocco, and Chihara Sin'yi, based on the linearization of equations of one-dimensional flow. The effect of the nozzle shape on the reflection of disturbances is analyzed by reference to calculations for nozzles differing from the investigated Laval nozzle. Five figures, twelve formulas, twenty three bibliographic references.

"Method of 'Direct' Calculation for Two-Dimensional and Three-Dimensional Supersonic Flows. I"

Moscow, Zhurnal Vychislitel'noy Matematiki i Matematicheskoy Fiziki,  
Vol 12, No 2, Mar/Apr 72, pp. 441-463

Abstract: The "direct" or "shock-capturing" method for calculating two-dimensional (plane and axisymmetrical) and three-dimensional supersonic flows of an inviscid, nonconducting gas is investigated. The basis of the method is a difference scheme which represents a steady-state analog of a known difference scheme proposed by S. A. Godunov for solving non-stationary problems in gasdynamics. The proposed method is not explicit and does not require special separation of shock waves, regions close to the angular points, and other singularities arising inside and on the boundaries of the region occupied by the flow. The method is very simple from the aspect of utilizing a computer, thus justifying its use in calculating both discontinuous and smooth flows. The efficiency of the method is illustrated in examples of calculating two-dimensional and three-dimensional flows. The accuracy of the calculation is controlled

"Grid-Characteristic Method for Calculating Plane and Axisymmetric Supersonic Two-Phase Flows"

V sb. Lopatochn. mashiny i struyn. apparaty (Vane Machines and Jet Equipment --- Collection of Works), No. 6, Moscow, "Mashinostroyeniye", 1972, pp 163-178 (from RZh - 34. Aviatsionnyye i raketnyye dvigateli, No 9, Sep 72, Abstract No 9.34.104)

Translation: The problems of calculating plane and axisymmetric supersonic two-phase flows by the grid-characteristic method are discussed. Basically the two-liquid model was discussed, which replaces the actual flow with a mutually penetrating motion of two interacting continuous media: the actual gas and a "gas" of particles deprived of pressure. Methods for solving elementary problems and determining the parameters at characteristic points are described and a general method of calculating the flow in the channel is given. Sample calculations are presented for the flow of a gas mixture with particles of different natures in an axisymmetric nozzle using the proposed method. The results of a one-dimensional approximation and the results of

"Some Results of a Numerical Study of Unconventional Plumes of Ideal Gas"

Moscow, Izv. AN SSSR: Mekhanika Zhidkosti i Gaza, No 4, Jul/Aug 72, pp  
102-109

**Abstract:** The authors give the results of an investigation of supersonic jets of an ideal (inviscid and thermally nonconductive) gas escaping into space with reduced pressure in cases where the cross section of the jet at the nozzle tip is noncircular. The study is based on numerical integration of equations of three-dimensional supersonic flow using a "continuous" difference method of computation which enables flow calculation without isolating the shock waves which are typically formed in this type of problem. Principles governing the behavior of nonstandard exhaust plumes are given for nozzles with elliptical and nearly rectangular output. Calculations were done on the "BESM-6" computer.

"Solution of the Variation Problem of Constructing the Outline of the Composite Nozzle"

Moscow, Prikladnaya Matematika i Mekhanika, Vol 35, No 4, 1971, pp 619-632

**Abstract:** A solution was found to the variation problem of constructing the outline of the supersonic part of an optimal composite nozzle designed for operation in two different modes. The complete nozzle operates in the mode which is characterized by the larger pressure drop. The end section of the nozzle is retracted (or extended) in the mode with lower pressure drop. The maximum allowable length of the complete nozzle and the counterpressure determining each mode and the probabilities of using the complete nozzle or part of it are given. The nozzle design is optimized with respect to the average thrust. The necessary conditions under which the optimal outline can be constructed are obtained, and the corresponding numerical algorithm based on these conditions is developed. Examples are presented of optimal composite nozzles constructed using the indicated algorithm. They are compared with the optimal continuous nozzles designed for the average counterpressure. The evolution of the shape of the optimal composite nozzle in the entire range of possible values of the maximum allowable length is analyzed.

"On Plotting the Contour of a Laval Nozzle with Regard to Change of Flight  
Conditions of a Space Vehicle"

Moscow, Prikladnaya Matematika i Mekhanika, Vol 34, No 6, Nov/Dec 70,  
pp 1067-1075

Abstract: A solution is found for the problem of plotting the rigid (nonadjustable) contour of the convergent-divergent section of a nozzle which is optimum in the sense of solving some trajectory problem with regard to change in the flight conditions and the mode of engine operation. The space vehicle is assumed to be a material point of variable mass, and drag at each instant is assumed to be equal to the corresponding steady-state value. The same approach is used to analyze flow in the nozzle. This means that the pressure and other parameters at each instant are defined by the equations of steady-state flow (in the coordinate system associated with the nozzle) under the conditions which exist at the nozzle inlet at that instant. In addition to the general results, two cases are studied in detail where the solution of the problem with the use of derived optimality conditions is comparatively simple. The first case is realized when the distribution of Mach numbers at

Nov/Dec 70, pp 1067-1075

the nozzle inlet does not change during flight. It is found that the optimum contour in this case is a member of a family of contours which correspond to solution of a variational problem with fixed conditions. The second case is realized when the flow at the nozzle inlet remains uniform and supersonic throughout the flight, and the nozzle is flat and "short". In this instance, the resultant optimum nozzle is rectilinear. The problem of profiling the convergent-divergent section of a flat or axisymmetric nozzle which realizes maximum thrust with a fixed flow at the inlet and predetermined external conditions has already been fairly completely solved. The problem as formulated in this paper deals with the fact that changes in flight conditions and the parameters at the inlet in many applications may be quite considerable, the flow at the inlet to the Laval section of the nozzle changing as a result of variations in flight conditions and changes in engine operation.
