"Concerning Thermal Effects Originating In The Process Of Growing Films In A Vacuum"

Sb.nauch.tr. po probl. mikroelektron. Nauk in-t elektron. tekhn. (Collection Of Scientific Works On Problems Of Microelectronics, Moscow Institute Of Electronics Technology), 1971, Issue 7, pg 19-25 (from RZhElektronika i Sverprimeneniiye, No 6, June 1972, Abstract No 6A60)

Translation: An evaluation is made of the change of temperature of a film or exposure to heat flux from an evaporator, as applied to the growth of epitaxial films of germanium at a rate on the order of 20-30 Å/sec with a 800° C temperature of the substrate. Simultaneously, epitaxial films 1000-1500 Å thick were prepared by vacuum evaporation with the indicated conditions of growth. The results of a computation were compared with experimental data. As tests showed, in the process of growth of the film at a high initial temperature and low rates of deposition, the change of the temperature of the growing film is slight. Apparently, the steadiness of the regime of condensation is of vital importance, a change of which can add to a worsening of the structure and to a change of the properties of epitaxial films with respect to thickness. 16 ref. "Investigation of Germanium Single Crystals Grown From a Drop of Melt on a Dissimilar Substrate"

Sb. nauchn. tr. po probl. mikroelektron. Mosk. inst. elektron. tekhn. (Collected Scientific Works on Problems of Microelectronics. Moscow Institute of Electronic Technology), 1970, vyp. 5, pp 64-75 (from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6V184)

Translation: In connection with a study of methods of creating active elements of microcircuits, an investigation is made of the singularities of crystallization of a drop of germanium melt on dissimilar substrates (ruby, sapphire). The range of substrate cooling rates is established which gives fairly perfect germanium single crystals 1-3 mm in size. The electrophysical properties of the resultant crystals are studied. Resumé.

"Solution for Electrochemical Etching of Metals"

USSR Author's Certificate No 306917, filed 7 Apr 69, published 23 Aug 72 (from RZh-tekhnika, no 6 (11), Jun 72, Abstract No 61.5.62)

Translation: A solution containing  $\text{Ag}_2\text{O}_3$  is patented for electrochemical etching of metals. It is distinguished by the fact that in order to improve the quality of cutting, a product made of Cu and its alloys,  $\text{MgCO}_3$  has been introduced into it. The composition of the solution (in % by weight) is as follows: 7.9-8.1%  $\text{Na}_2\text{CO}_3$ , 1.9-2.1  $\text{K}_2\text{SO}_4$ , and the rest water. Example. When marking with a solution containing 8%  $\text{Na}_2\text{CO}_3$  by weight, 1.9%  $\text{K}_2\text{SO}_4$  and the rest water at a voltage of 5 volts on plates made of copper and EKE-3 bronze, a clear image of the symbols is obtained which is not removed during machining.

"On Some Electrical And Optical Properties Of Acousto-Electric Domains In GaAs"

Fizika i tekhnika poluprovodnikov, Vol 6, No 4, Apr 1972, pp 625-631

**Abstract:** The work is devoted to a detailed study of the distribution of the field in a specimen and to the establishment of the connection between the electrical characteristics in the domain and the infrared radiation. The experiments were conducted at room temperature on 12 x 0.6 x 0.7 mm GaAs specimens with  $n = 2 \cdot 10^{15} \text{ cm}^{-3}$  and  $\mu = 4000 \text{ cm}^2/\text{v.sec}$ , oriented in the [110] direction. In specimens of compound section the effect was also studied of artificially created nonuniformities on the motion and properties of the domain. Infrared radiation from specimens with an acousto-electric domain is studied. At the boundary of the nonuniformities, where the field increases in the domain as a result of the effects of the acousto-electric flux, infrared radiation with a maximum of  $\sim 9100 \text{ \AA}$  appears. Possible mechanisms of the radiation are considered. The authors thank N.I. Paninoy for production of the specimens and V.S. Vavilov for discussion of the results of the work. 6 fig., 6 ref. THE EFFECT OF MYOCARDIAL INFARCTION ON LIFE EXPECTANCY AND MORTALITY RATE  
Article by F.J. Friberg, G.M. Larsson, S.F. Lundström, Associate Professor  
at the General Practitioner Research Institute, chair of family therapy  
headed by Professor T.G. Larsson and chair of public health organization  
headed by Doctor S.C. Grankvist of Stockholm Medical Institute, Sweden.  
Published in *Scandinavian Journal of Primary Health Care*, 1977, Vol. 5, No. 1, pp. 1-12.

Investigation of life expectancy and health status of individuals who  
have suffered myocardial infarction, with respect to different factors affecting the  
long range survival in such patients is both practically and medically important.  
Of special interest is determination of residual fitness for work of  
patients with permanent cardiocachexia. Such investigations could  
define the needs of rehabilitating them.

We have the results of long term (12 years) observation of 222 patients  
who had suffered at least myocardial infarction, discharged from a recent  
hospital in Sweden, which is the medical and medical unit for the Umeå Municipal  
Machinery Plan. Among the patients studied there were 155 men and 113 women.  
There were 208 who suffered myocardial infarction in spite of fitness of age,  
and 116 were asymptomatic prior to illness. In 96 cases the illness extended  
over 10 years and for the rest the period was shorter.

Our data refer to the absolute majority of cases of myocardial infarction  
in one of the city's regions; the element of selectivity is ruled out  
and for this reason, we believe, it furnishes a rather realistic idea about  
long term sequelae.

One of the chief factors determining life expectancy of individuals  
who have suffered myocardial infarction is the patient's age. As indicated by  
most authors (G.I. Yankovsk; A.M. Berlinskaya et al.; S.I. Sudarov; T.T.  
Gukhman; K.Y. and L.T. Bilyavich; Vaisse; Sigler, and others), the long term  
sequelae are the most favorable among patients who are young or middle aged,  
according to survival indices.

"The Reaction of Manganese  $\pi$ -Cyclopentadienylphosphine Complexes With Tin (IV) Chloride"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 2, 1973, pp 481

Abstract:  $\pi\text{-C}_5\text{H}_5\text{Mn}(\text{CO})_2\text{L}$  (I) was found to react with  $\text{SnCl}_4$  in  $\text{CH}_2\text{Cl}_2$  to form the inclusion complex  $\text{C}_5\text{H}_5\text{Mn}(\text{CO})_2\text{L}\cdot 2\text{SnCl}_4$  (II), where  $\text{L}=\text{PPh}_3$ ,  $\text{AsPh}_3$ ,  $\text{P}(\text{i-C}_3\text{H}_7)_3$ , and  $\text{P}(\text{C}_6\text{H}_{11})_3$ . Compound II appears as a yellow or brown substance which is stable in an argon atmosphere or in sealed ampules. In solutions containing O or N atoms (water, alcohols, acetone, ether, MeCN), II breaks down instantly to regenerate I. Compound II is insoluble in apolar solvents (benzene,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ ,  $\text{CS}_2$ ), weakly soluble in  $\text{MeNO}_2$ , and more soluble in  $\text{PhNO}_2$ . The latter solution conducts electricity. During the formation of II the stretch frequencies of CO increase by 70-100  $\text{cm}^{-1}$ , which indicates decreased electron density on the Mn atom.

"Characteristic Features of the  $\gamma$ -Cyclopentadienylphosphine Complexes of  
Manganese in Hydrogen Exchange Reactions with Acids"

Moscow, Doklady Akademii Nauk SSSR, Vol 208, No 6, 1973, pp 1353-1355

Abstract: It was demonstrated earlier [D. N. Kursanov, et al., Izv. AN SSSR, ser. khim., 2842, 1969; V. N. Setkina, et al., 434, 1971; A. G. Ginsburg, 177, 1971] that replacement of one of the Co ligands in the  $\text{Co}(\text{Cp})(\text{CO})_3$  ( $\text{Cp} = \gamma\text{-C}_5\text{H}_5$ ) by the tertiary phosphines  $\text{PR}_3$  leads to acceleration of the acid hydrogen exchange by 2-4 orders depending on the nature of the R radical. A study has now been made of the reactivity in the acid hydrogen exchange reactions of cyclopentadienyl complexes of manganese containing bidentate tertiary phosphines with the structure  $\text{Ph}_2\text{P}(\text{CH}_2)_n\text{PPH}_2$  ( $n = 1 - 3$ ).

The kinetics of the hydrogen exchange reaction were investigated by the deuterium content in the initial material isolated after interrupting the reaction by pouring the reaction mixture into a sodium solution. The values  $\delta$  of the chemical shifts are presented on the  $\delta$ -scale (internal standard — hexamethyl disiloxane for the paramagnetic resonance spectra and tetramethyl silane for the  $\text{C}^{13}$  nuclear magnetic resonance spectra).

"Cyclopentadienylmanganese dicarbonyl triphenylphosphines Substituted in the  
Cyclopentadienyl Ring"

Leningrad, Zhurnal Obshchey Khimii, Vol 42(104), No 12, Dec 72, pp 2665-2667

**Abstract:** Carbonyl ligands in complex transition metal compounds can be easily replaced by PPh<sub>3</sub> group upon irradiation with UV light. This method was used to synthesize derivatives of CpMn(CO)<sub>2</sub>PPh<sub>3</sub>, where Cp = C<sub>5</sub>H<sub>5</sub>, containing Et, PhCH<sub>2</sub>, MeS, Cl, Br, I, and COONa substituents in the Cp ring, from the respective derivatives of CpMn(CO)<sub>3</sub>. The new products are yellow crystalline compounds with high melting points. In the solid state they are stable in air, dissolve easily in CCl<sub>4</sub>, CHCl<sub>3</sub>, and CS<sub>2</sub>. The structure of these products was confirmed by PMR and IR spectroscopic analysis.

"Kinetic Isotope Effect of Hydrogen Exchange in Cyclopentadienylmanganese-tricarbonyl and Cyclopentadienylmanganese-dicarbonyl-triphenyl phosphine"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 2, Feb 72,  
pp 316-322

**Abstract:** Experimental results are reported on the determination of the kinetic isotope effect (KIE) of hydrogen exchange in cyclopentadienylmanganese-tricarbonyl (CMT) and cyclopentadienylmanganese-dicarbonyl-triphenyl phosphine (CMDP). In many reactions CMT behaves like benzene. Introduction of an alkyl group lowers the exchange rate of hydrogen. Determinations of KIE of hydrogen exchange with acids were carried out under similar conditions for CMT, CMDP, benzene derivatives and ferrocene, and it was shown that both in the CMT and CMDP it occurs by the same mechanism as in case of aromatic compounds. On the other hand, hydrogen isotope exchange if AHP catalyzed by basic agents has a protophilic mechanism, analogously to ferrocene, the slowest step being the breaking of the C-H bond by the base.

"Quantitative Evaluation of the Effect of Triphenylphosphine and  
Triphenyl Phosphite Ligands in  $\pi$ -Cyclopentadienylidicarbonylphosphinic  
Complexes of Manganese"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No. 2,  
Feb 71, pp 434-435

Abstract: Tertiary phosphines and phosphites are stronger donors than  
the carbonyl groups in transition metal complexes.. When one of the  
carbonyl groups of cyclopentadienylmanganese tricarbonyl ( $\text{CP}_{\text{h}}\text{T}$ ) was  
replaced with  $\text{PPh}_3$  or  $\text{P}(\text{OPh})_3$ , the rate of acid hydrogen exchange was  
increased 2000- and 70-fold, respectively. Such an exchange leads  
to a higher electron density, increased rate of electrophilic reactions  
in the cyclopentadienyl rings  $\pi$ -bonded to the transition metal. Ham-  
met's equation holds for the acid hydrogen exchange of  $\text{CP}_{\text{h}}\text{T}$ .

"Effect of a Radical Bound to a Phosphorus Atom in the  $\text{C}_6\text{H}_5\text{P}(\text{O})_2\text{PR}_3$  Complexes on the Rate of Hydrogen Exchange in the Ring and on the Frequency of Carbonyl Stretching Vibrations"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 1, Jan 1, pp 177-179

**Abstract:** Hydrogen exchange reaction between  $\text{CF}_3\text{COOD}$  and  $\text{C}_6\text{H}_5\text{P}(\text{O})_2\text{PR}_3$  in dichloroethane at  $25^\circ$  was studied. The reaction was found to depend on the radical attached to phosphorus. The rate of hydrogen exchange in the cyclo-pentadienyl ring increases with a transition from triphenylphosphine to trialkylphosphine substituents. In the series  $\text{R} = \text{OC}_6\text{H}_5$ ,  $\text{C}_6\text{H}_5$ ,  $\text{C}_6\text{H}_4$ ,  $\text{isoC}_6\text{H}_{11}$  the rate of hydrogen exchange increases and the frequency  $\nu = \omega$  decreases.

"Corrosion of Materials in a Distillate Containing Dissolved Gases"

Moscow, Vodosnabzheniye i Sanitarnaya Tekhnika, No 8, 1970, pp 4-8

Abstract: In connection with the present practice of supplying arid districts with desalinated sea water, the experimental-industrial plant at Shevchenko has been studying intake pipe corrosion for several years, especially the corrosion of carbon steel pipes, which process at 0.12-0.17 g/m<sup>2</sup>-hr.

It was found that dissolved gases (oxygen, carbon dioxide) in the distillate are a prime cause of the corrosion of carbon steel intake pipes, and that their removal can cut corrosion by almost half. Further, aluminum can be used as pipe material, regardless of the gases, provided the copper ion content is limited and there are no more than 20 mg/l of iron ions present. Finally, galvanized steel can be used, without condition. But all of these materials are subject to a slight degree of corrosion.

"A Method of Making Ferrite Magnetic Heads"

Moscow, Otkrytiya, Izobreteniya, Proryshlennyye Obranty, Tsvetnyye Znaki, No 30, Oct 71, Author's Certificate No 317100, Division C, filed 22 May 70, published 7 Oct 71, p 184

Translation: This Authors' Certificate introduces a method of making ferrite magnetic heads by adding a vitrifying material in the working gap between ferrite cores, and heating it to the vitrification point. As a distinguishing feature of the patent, the manufacturing process is simplified by impregnating a porous material such as ash-free filter paper with the vitrifying material, drying, and placing a sheet of the impregnated material between the ferrite cores.

"Utilization of Brightness Hysteresis for Recording Images on Ferromagnetic Film"

Moscow, Zhurnal Nauchnoy i Prikladnoy Fotografii i Kinoematografii, Vol. 17, No 3, 1972, pp 219-220

**Abstract:** A method for recording images on ferromagnetic film is described, in which the azimuthal angle and the diffraction angle do not change and the image is obtained due to different intensity of the diffracted illumination on illuminated and unilluminated sectors. The new method is based upon the hysteresis nature of the relationship of diffracted-radiation intensity to a normal magnetic field. The hysteresis is manifested in the change of diffraction intensity after the action of a normal field upon a film with band domains. This change of diffraction intensity, brought about by the normal magnetic field, can be "photographed" by heating the film. This forms the basis of the new recording mechanism by means of which the image is fixed on the film in the form of sectors with different diffraction intensities. Pulse laser radiation is used to obtain the image. The sensitivity of this recording

"The Problem of the Elastic Stability of a Locally Loaded Cylindrical Shell"

Moscow, Prikladnaya matematika i mekhanika, vol 36, No 6, 1972,  
pp 1123-1129

**Abstract:** This paper studies the effect of the nonlinearity of an axially symmetrical deformation in a semi-infinite circular cylindrical shell at the end of which is a transverse uniform stress, on its resistance to infinitely small asymmetrical perturbations satisfying swivel support conditions at its end. One of the characteristic problems in the local stability of cylindrical shells is considered; nonlinear equations describing the deformation of the shell with arbitrary rotational angles are used to determine the shell's precritical state. The critical value of the end stress is defined as the least eigen-value of the loading parameter; the problem of determining this value is solved by finding an expression for the critical load. The authors note that the solution to the linear precritical state is useful only for very fine shells.

"Stating the Problem of Local Stability of Shells of Rotation"

Moscow, Doklady Akademii nauk SSSR, vol 206, No 4, 1972, pp 838-840

**Abstract:** With regard to the general theory of the stability of fine shells, the authors pose the question: to what extent is the linear theory useful in describing the pre-critical stress state with a local nature? The answer to this question can only be given from the viewpoint of nonlinear theory, and the authors begin by considering a semi-infinite circular cylindrical shell with a transverse compressive force applied to its free end. The boundary problem of the shell's symmetrical deformation reduces to a system of two equations, from which it is found that the deformed shell is a shell of revolution. The formulas for the stress functions and the sag are brought into these equations, and the problems of determining the critical value of the load parameter and the corresponding problem of the wave-forming parameter are solved.

"Supercritical Behavior of a Cylindrical Envelope with Combined Application of Loads"

4-ya Vses. Konf. po Probl. Ustoychivosti v Stroyit. Mekh., Tezisy Soiss.  
[Fourth All-Union Conference on Problems of Stability in Structural Mechanics, Theses of Reports -- Collection of Works], Moscow, 1972, pp 133-134, (Translated from Referativnyy Zhurnal, Mekhanika, No 10, 1972, Abstract No 10 V328).

Translation: The supercritical behavior of a cylindrical shell under the influence of axial forces and a circular load is studied. The solution is presented on the basis of nonlinear equations of smooth shells with fixed form of bending function, using the Bubnov method. The bending function is selected so that it contains components reflecting the subcritical curvature of the generatrix of the shell, plus terms describing the bifurcation at the moment of loss of stability. The system of nonlinear algebraic equations produced for bending amplitudes is studied from the point of view of development of the equilibrium shapes of the shell arising upon loss of stability. The results of calculations show that the decrease in loads with increasing bending in the supercritical area occurs even with values of axial compression parameter  $p > 0.15$  ( $p = N/N_e$ , where  $N$  is the 1/2

JPA5 5205\*Rock Density at High Pressure

(Abstract: 'Study of Density of Rocks from Central Kazakhstan Under High Pressures,' by M. P. Volarovich, A. K. Kurskaya, A. I. Lopatin, I. S. Tomashevskaya, I. L. Tuzova and B. Sh. Dragayev, Institute of Physics of the Earth, Academy of Sciences USSR, and Institute of Geological Sciences, Academy of Sciences Kazakh SSR; Moscow, Izvestiya Akademii Nauk SSR, Fizika Zemli, No. 1, 1970, pp. 46-51)

The density of rocks of various composition from Central Kazakhstan was determined at high pressures in the laboratory. Rock tests were at quasihydrostatic pressures up to 15 kb. The apparatus used made it possible to measure the velocities of elastic waves. The sample was compressed by hard-alloy pistons. Change in volume (from displacement of the piston) was determined simultaneously with measurements of the velocity of longitudinal waves. Change in density at different pressures was computed using the formula

$$\rho = \frac{\rho_0}{1 - \Delta V/V}$$

Reel/Frame

19700902

12

AP0045878

where  $\rho_0$  is the initial density of the sample in g/cm<sup>3</sup>,  $\Delta V/V$  is the volume decrement. Change in density was determined with an error of about 5 percent. Samples were selected along two deep seismic sounding profiles. Under the applied pressure density of all rocks increased. Density changes were greatest in the initial phase to 4 kb. Later the changes became less and the density-pressure curves flattened out. The greatest density changes were observed in samples of ancient metamorphosed rocks: schists, gneisses and porphyroids of more acidic composition for which the density changes at 15 kb attain 3.5 percent. The density of granites also changes rather sharply and increases continue to 15 kb. Relative density changes are dependent on initial density: the lesser the density at atmospheric pressure, the greater is the change when pressure is applied. The maximum changes in density for rocks of acidic composition are evidently caused by their greater inhomogeneity than for rocks of basic composition. Acidic rocks are also poorly preserved. Defects in the rock, largely microfissures, close under pressure and density at the attained pressures approaches an identical value for rocks of similar composition. For rocks of basic and ultrabasic composition the density change at pressures up to 15 kb does not exceed 2 percent, that is, the compressibility of rocks of acidic composition is greater than for basic

2/3

19780903

AP0045878

rocks by approximately a factor of 1.5. Density is dependent primarily on chemical and mineralogical composition. Differentiation of rocks by density corresponds to their basicity. The density of granitomes at high pressures approaches the density of granodiorites. Tuff-diorites approach the density of diorites. The density of eclogites from northern Kazakhstan is less than the density of eclogites from other regions. The low density of eclogites in northern Kazakhstan can be attributed to the fact that they contain quartz (up to 15-20 percent). The results of studies of rock densities at high pressures can be used in the geological interpretation of geophysical data. The authors used such data in constructing a density cross section of the crust in central Kazakhstan.

"Optical Memory"

Riga, Nauka i Tekhnika, No 2, 1973, p 24

Translation: Nowadays, the use of magnetic elements in the memory of an electronic computer permits the introduction of some 10 million bits of information. The computer's speed is 1 bit/ $10^{-7}$  seconds. But these specifications are not enough to satisfy computer specialists, and the problem has now arisen of designing machines with a memory capacity of  $10^{12}$  bits and capable of processing information at the rate of 1 bit per  $10^{-9}$  seconds. Apparently, such a computer can be built by using optical memory elements through which information can be recorded and calculated by the use of light. The optical memory elements of the computer are connected with the other blocks through photoelectric sensors (photoelements) which convert the optical signal into electricity.

Optical memory elements are especially interesting, since they afford the possibility of using lenses to focus light beams on an area with a one-micron diameter. Thus, as much as  $10^8$  information bits can be recorded on a single 1/2

USSR

SHVARTS, KURT, Nauka i Tekhnika, No 2, 1973, p 24

square centimeter of the optical medium. If a laser is used as the light source in the computer, the time for information recording and processing can be cut to 10-8-10-10 sec. This explains why computer specialists have turned their attention to optics.

For optical recording of information, materials are needed whose characteristics (such as color and index of light refraction) vary under the influence of incident light. Among such materials are various organic dyes, plastics, and semiconductors; there is also a great deal of interest in inorganic compounds -- ionic crystals.

"Reactivity of Ambident Anions. Selective Solvation of Acetoacetic Ester Anion in Alkylation Reactions"

Leningrad, Zhurnal Organicheskoy Khimii, Vol 7, No 11, Nov 71, pp 2233-2236

Abstract: Kinetics of the O-alkylation and C-alkylation of potassium enolate of the acetoacetic ester with ethyltosylate in a binary mixture hexamethylphosphotriamide-ethanol was studied. It was established that the reaction rate of both of these reactions increases with increasing quantity of the dipolar aprotic solvent in the mixture. It has been shown that when a change is made from alcohol to hexamethylphosphotriamide [hexametapol], the O-alkylation rate is increased 400-fold, while the C-alkylation is increased only about 25-fold. This is due to the selective solvation of the oxygen center of the anion with the proton containing solvent. Substituting deuterioethanol for ethanol is reflected only in overall reaction rate, the ratio of isomers remaining unchanged.

"Corrosion of Zirconium in Hydrochloric Acid"

V sb. Korroziya i zashchita met. (Metal Corrosion and Protection -- Collection of Works), Moscow, "Nauka," 1970, pp 66-69 (from RZh-Metallurgiya, No 12, Dec 70, Abstract No 12 I834 by the authors)

Translation: Zirconium is stable in 20 and 30% solutions of HCl unless the concentration of oxidizing agents exceeds 0.01-0.5 g/l. With an increase in the concentration of oxidizing agents, pitting is observed, as well as an increase in total corrosion. The tendency toward pitting is estimated according to pitting potentials measured by the galvanostatic method. Zirconium does not undergo hydrogen embrittlement in HCl and can therefore be used to make insoluble cathodes operate in reducing media. Two illustrations. Bibliography of four titles.

"Test Results on Installations and Electrode Materials in a Plasma Jet"

Moscow, Teplofizika vysokikh temperatur, No. 3, May/Jun 72, pp 635-639

**Abstract:** The characteristics of electrodes of silicon carbide with additives of alloying metals (Mo, Ti, Cr), interelectrode insulators of refractory concretes based on high-alumina VGB and AFB concretes and magnesian MM concrete and module insulation walls of MB concrete were investigated in a model of an MHD generator. The maximum electrode temperature during the experiments reached 2300°K, the interelectrode insulators reached 2100°K and the installation walls reached 1700°K. The electrode samples were prepared by pressing a mixture of SiC powder and the appropriate alloying additive (Mo, Ti, Cr) with organic binding, and subsequent heat treatment at a temperature of 2100°C for 10-15 min. The experimental device in which the materials were tested consisted of the following elements: a plasmatron producing an air flow with a

temperature of 3000°K, a mixing chamber where an easily ionized additive was introduced into the air flow in the form of potassium or  $K_2CO_3$  vapors, a nozzle, the MHD generator channel, and a system for evacuating the gas flow. The flow rate in the channel was approximately 500 m/sec. The advantages of a sectional structure for the channel are shown and it was established that the current density is determined by the conductivity of the films from the interaction products of the electrode and additive materials, independent of the type of alkali additive (potassium or potash vapor) at the temperature of its condensation on the electrode surface. At an electrode temperature of less than 900°K in supplying K-vapors and of 1200°K in supplying  $K_2CO_3$  powder, the current density remains constant at 0.2  $A/cm^2$ . At these temperatures the current density is evidently determined by the conductivity of the liquid film of the interaction products of the additive material, the working gas, and the electrode and of their emission properties. With an increase in electrode temperature above 900-1200°K the emission properties of the electrode material directly begin to play a basic role.

"The Microcirculatory Bed of the Skin and Its Appendices Under Normal Conditions and During Long-Term Exposure to Coldness"

Leningrad, Arkhiv Anatomii Gistologii i Embriologii, Vol 60, No 5, May 71,  
pp 40-45

**Abstract:** The purpose of this study was to investigate the microcirculatory bed of the skin and its appendices in connection with the blood supply of the hair, as well as the characteristics of the changes in the blood supply of the skin and its appendices (the capillary follicles) in ontogenesis and under the prolonged action of some agent on the skin (particularly the effect of coldness). Portions of the skin from the hairy part of the head from deceased persons who had died accidentally were used. Arterial as well as venous networks are distributed in a plane parallel to the skin surface at the boundary between the vascular and subvascular layers. The arterioles have a width of 12-15  $\mu$ , the venules have a width of 20-25  $\mu$ . Precapillary and postcapillary members could be distinguished in these skin networks (by an impregnation method). The blood supply of the hair follicles, which are appendices of the skin, takes place through

1/2

USSR

KURTYUKOVA, T. I., Arkhiv Anatomii Gistolohii i Embriologii, Vol 60, No 5, May 71, pp 40-45

perifollicular vessels coming from the subpapillary and subdermal arterial networks as well as from the subpapillary, intradermal, and subdermal venous networks. The terminal vascular bed of hair follicles is characterized by a longitudinal arrangement of the arteriole and venule members and a dense capillary network which is most clearly evident at the level of the functionally active part of the hair root. The interorgan vascular bed of the skin in regions of old-age baldness differs by the broadening of the components of the venule member at all levels, by blood stasis in venules, and atrophy of the vascular network in the hair follicle. The microcirculatory bed of the skin of rabbits was found to respond to prolonged local exposure to coldness by dilatation of venule and capillary members, blood stasis in them (immediately after the experiment), considerable broadening and diapedesis of blood cells, destruction of vascular walls, and subsequent formation of new capillaries.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. MOLO LINING COMPNS. USED IN PRESSURE HOLDING OF METALS WERE PREPD. FROM MOS SUB2, EPOXY RESINS, DI-BU PHTHALATE, AND POLYETHYLENE POLYAMINE DILD. WITH NITRO CONTG. SOLVENTS. A COMPN. OF THIS TYPE WAS DILD. WITH A MXT. OF PHE, BUCH, ETOH, ME SUB2 CO, ETHYLENE GLYCOL, AND BU OR AMYL ACETATE, COATED ONTO THE WALL OF A MOLD, AND DEGREASED WITH ME SUB2 CO OR ETOH. THE COATING HARDENED MORE QUICKLY THAN PREVIOUS COATING COMPNS. TO GIVE A SMOOTH THIN LINING WHICH INCREASED THE EASE OF REMOVAL OF THE CASTING. AFTER 2-3 CASTINGS, THE SURFACE WAS WASHED WITH PETROLEUM AND RECOATED.

TITLE: A Device for Finishing (Polishing, Dressing) Flat Surfaces of Articles Particularly the Surfaces of Cutting Blades of Cutters Used in Planing Films Out of Fluorine Plastics

PERIODICAL: Byulleten' izobreteniy, 1960, No. 13, p. 73

TEXT: Class 67a. 6. No. 129961 (648183/25 of December 19, 1959). This device contains a vessel (cup) with lapping material to which are imparted directional vibrations by a vibrator. It has the following special feature: to achieve a precise fitting of surfaces being lapped to the lapping plate (the bottom of the vessel), and to impart to them a planetary work motion with respect to the plate axis, this device is fitted with pressure disks holding the articles and pressing them against the lapping plate. The disks, together with the articles they hold, rotate round their axes and round the vessel axis, under the effect of the vibrations in the vessel imparted to it by the vibrator.

ABSTRACT/EXTRACT--(U) CP-0- ABSTRACT. THE THEORY IS ADVANCED THAT LOW FREQUENCY OCEAN NOISES ARE GENERATED BY TURBULENT WIND ACTION AT THE SURFACE. THE ACTION OF THE WIND ON THE WATER SURFACE IS VIEWED AS A SYSTEM OF RANDOM TANGENTIAL PRESSURE FORCES DISTRIBUTED OVER THE OCEANIC SURFACE DEPENDENT ON THE CHARACTER OF THE WIND (VELOCITY, TURBULENCE) AND THE FORM OF THE DISTURBED SURFACE. THE SPECTRAL DENSITY OF NOISE PRESSURE IS EXPRESSED BY THE SPECTRUM OF SURFACE WAVES AND THE COEFFICIENT OF ATTENUATION OF THESE WAVES. THEORETICALLY COMPUTED NOISE LEVELS AND THE DEPENDENCE OF THESE LEVELS ON THE FREQUENCY, DEPTH, AND VELOCITY OF WIND ARE COMPARED WITH EXPERIMENTAL RESULTS IN THE LITERATURE. IT IS CONCLUDED THAT DIRECT WIND ACTION ON THE SURFACE LAYER IS ONE OF THE REASONS (PERHAPS THE MAIN REASON) FOR THE GENERATION OF LOW FREQUENCY OCEAN NOISES. FURTHER IT IS CONCLUDED THAT DIRECT WIND ACTION ON ICE FORMATIONS AND OVER THE SURFACE OF THE EARTH ALSO HAS A ROLE IN THE FORMATION OF NOISES UNDER THE ICE AND SEISMIC NOISE IN THE EARTH.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. SPECIMENS OF COMPLEX ALUMINOSILICATES CONTAINING BORON NITRIDE WERE STUDIED UNDER THERMAL LOADING CONDITIONS UP TO 2,500 DEGREES C TO DETERMINE THE CHARACTERISTICS OF CRACK FORMATION AND DESTRUCTION OF THESE REFRACATORY MATERIALS. TO REGISTER THE TEMPERATURE DURING TESTING, SPECIAL THERMOMETRIC SPECIMENS WITH BUILT IN THERMOCOUPLES WERE MADE. THE TIMES OF FRACTURE WERE DETERMINED BY CURRENT CONDUCTING PICKUPS. IT WAS FOUND THAT COMPOSITIONS CONTAINING 40-50 PERCENT BORON NITRIDE ARE MOST RESISTANT TO THERMAL LOADING. WHEN THE BORON NITRIDE CONCENTRATION WAS HIGH (60 PERCENT OR MORE) THE FRACTURE OF THE CYLINDRICAL SPECIMENS WAS CHARACTERIZED BY BOTH RADIAL AND ANNULAR CRACKS. ANALYSIS OF THE FRACTURED SURFACES REVEALED THAT THE ABILITY OF THESE MATERIALS TO WITHSTAND THERMAL LOADING DEPENDS TO A CONSIDERABLE EXTENT ON THE DISTANCE BETWEEN CORUNDUM GRAINS AND THE UNIFORMITY OF THEIR DISTRIBUTION. IT WAS FOUND THAT A REFRACATORY MATERIAL WHICH WITHSTANDS EXTREME TEMPERATURE DIFFERENTIALS MAY BE PRODUCED BY PROPER SELECTION OF THE RATIO OF COMPONENTS REFRACATORY CLAY, CORUNDUM AND A CERTAIN AMOUNT OF BORON NITRIDE.

"Effect of Urea on the Toxicity of Casein Plastein"

Nauchn. dokl. vyssh. shkoly. Biol. n. (Scientific Reports of Higher Schools. Biological Sciences), 1970, No 12, pp 35-37 (from RZh-Biologicheskaya Khimiya, No 10, May 71, Abstract No 10 F1696 from the résumé)

Translation: The protein-like substance casein plastela (I) which has a molecular weight of about 5000 when treated with a solution of 8 M urea loses much of its toxicity for rats after intravenous injection of a solution of native I. This appears to be the result of conformational changes in the structure of I and it suggests that I, which contains all the amino acids of the original protein, has a secondary structure.

"Inhibited Radiation Grafting Polymerization of Acrylonitrile in Poly-  
ethylene Films"

Minsk, Doklady Akademii Nauk BSSR, Vol 16, No 10, Oct 72, pp 901-904

**Abstract:** The effect of hydroquinone on graft polymerization of acrylonitrile in polyethylene films was studied. It was shown that addition of such an inhibitor does not lower the effectiveness of the influence of graft polymer on the properties of the materials, that it does counteract the formation of homopolymer and acids in regulating the distribution of the graft polymer throughout the entire material. This polymerization inhibition method may be used with various initiators. The inhibitor makes it possible to select optimal chain length of the graft materials as well as gradients of the polymerization rates in micronegions differing by their densities and properties.

"Cation Exchange in Dioxane-Water Solutions on Weakly Acidic Cation Exchange Resin KE-4P2"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol 33, No 2, Feb 80, pp 307-310

**Abstract:** A statistical method was used to study the exchange of  $\text{K}^+$  ions for  $\text{Li}^+$ ,  $\text{Cs}^+$  and  $\text{Ca}^{2+}$  ions on a carboxyl cation exchange resin (KE-4P2) in dioxane-water solutions. The  $\text{K}^+ \rightarrow \text{Cs}^+$  exchange is accompanied by an increase in the selectivity coefficient with increasing concentration of dioxane, while in the case of the  $\text{K}^+ \rightarrow \text{Li}^+$  and  $\text{K}^+ \rightarrow \text{Ca}^{2+}$  exchange, the coefficient is lower. The distribution of the exchanging ions between the weak acidic cation KE-4P2 phase in  $\text{K}^+$  form and the phase of external solution is affected by the pH. Basis of the resin's salt form in dioxane-water mixture; this value reaches a maximum when the concentration of dioxane in the mixture is 30%.

"Hydration Thermodynamics of a Strong Acidic Cation Exchange Resin KU-5"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol 38, No 10, Oct 71, pp 1013-1017

**Abstract:** Results of sorption-thermochemical determinations and analysis of thermodynamical functions of water adsorbed by the cation exchange resin KU-5 are reported. The  $K^+$ ,  $Na^+$ ,  $Li^+$ ,  $Ca^{2+}$ ,  $Mg^{2+}$ , and  $Al^{3+}$  forms of the resin were studied and the data were calculated from sorption and thermochemical determinations carried out at 20°. It has been established that the graphs of function magnitudes related to the quantity of the adsorbed water reflect the hydration process laws which are connected with the nature of fixed and exchange ions. Analogously to other investigated cation exchange resins, the most informative are the functions  $E_g = f(x)$ ; from them it is possible to get qualitative estimates on the input of various types of interactions to the total hydration energy.

Resumé)

Translation: The authors discuss the influence of various factors upon the ignition of particles of zirconium, titanium, magnesium, and zirconium hydride. The investigation was conducted by means of microphotographing the particles during heating in an atmosphere of air. The maximum temperature of the heater was 1900°K, the heating rate was from 2.5 to 120 degrees/sec. Particles 100 to 500 microns in size were investigated. The influence of the type of metal, particle size, heating rate, and porosity upon the ignition temperature was established. Zirconium, titanium, and zirconium hydride ignite in two stages. The first stage is smoldering, which is characterized by elevation of the particle temperature to a red glow. The second stage is a flare-up, characterized by the formation of a bright nucleus of light. Zirconium and 1/2

"Methyl Ester of  $\beta$ -Phenylacetoacetic Acid in Fisher Indole Synthesis"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 8, Aug 72, pp 1079-1082

**Abstract:** Methyl esters of  $\beta$ -phenyl- $\beta$ -hydrazinocrotonic acids substituted at the nitrogen atom form methyl esters of 3-phenylindole-2-acetic acids in presence of sulfuric acid, the reaction being carried out at room temperature. 2-benzylindole-3-carboxylic acid esters form only in very small amounts under these conditions. When the indolization is carried out at 190-200°, without catalyst, the direction is reversed, benzylindole-3-carboxylic acid esters forming predominantly. When reacted with polyphosphoric acid, these compounds yield derivatives of benzo[b]carbazole, which upon oxidation produce 6,11-dioxobenzo[b]carbazoles.

"Integrated Circuit With Programmed Structure Using MIS Memory Transistors"

Radiotekhnika i elektronika, Vol XVII, No 7, July 1972, pp 1551-1552

Abstract: The integrated circuit is described of an all-purpose element filled with conventional MIS [metal-insulator-semiconductor] transistors and MIS transistors with a memory (memory transistors). The integrated circuit realizes the following logical function:

$$z(t + \delta) = \bar{v}_{ai} x_i \quad (i = 1, 2, 3, 4),$$

where  $x_i$  is the input logical variables;  $v_{ai}$  is the state characterizing the  $i$ -th memory transistor;  $z$  is the output variable; and  $\delta$  is the delay. The circuit can be used for construction of a specialized array for fulfillment of logical, switching, and memory functions and also for construction of all-in-one structurally-uniform logical units, which makes it possible for each problem to organize a specialized computing device by a programmed adjustment of its elements. 1 fig. 5 ref. "Protein Metabolism in Experimental Berylliosis"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, № 5, 1970, pp 56-57

**Abstract:** Single injections of rats with BeO (intratracheally) or BeSO<sub>4</sub> (intramuscularly) decreased the albumin content, while increasing the content of alpha- and gamma-globulins in serum. Injections also decreased the content of SH groups in liver mitochondria. Radioisotope studies (1-C<sup>14</sup>-lysine and L-C<sup>14</sup>-glycine) revealed a high rate of incorporation of the isotope into soluble and insoluble proteins in both liver and lung tissue after the rats were poisoned with BeO. Thus, protein metabolism is significantly affected by beryllium. Shifts were noted primarily in the organs for which the element has an affinity. Shifts involved protein synthesis and lysis as well as protein structure (electrophoretic mobility, lowered level of SH groups).

Translation: A new version of the correspondence rule between classical variables and quantum operators proposed by the author (RZh-Fizika, 1970, 4341) is used to construct a "quantum distribution function"  $F(q, p, t)$  defined by the property that for the arbitrary classical variable  $A(q, p)$  the integral over the phase space  $(q, p)$  of the product  $A(q, p)F(q, p, t)$  is always equal to the mean value of  $A$  in quantum mechanics. It is shown that in contrast to the earlier proposed expression, the expression for the quantum distribution function assumes only positive real values and is 1-normalized. The given result is interpreted as complete equivalence of

"Possible Quantum Theory Variation"

Sb. nauch. rabot aspirantov. Un-t druzhby narodov im Patrice Lumumby. Fak. fiz.-matem. i estestv. n. (Collected Scientific Works of Postgraduates. University of Friendship of Peoples imeni Patrice Lumumba. Physics-Mathematical and Natural Sciences Department), 1970, vyp. 7, pp 205-210 (from RZh-Fizika, No 2, Feb 71, Abstract No 2B36)

Translation: A new version of the one-to-one rule of correspondence between classical variables and quantum mechanical operators is proposed. The indicated variation assumes that all physical quantities are given by functions in a phase space. It has the property that the quantum mechanics version generated by it is a theory with latent parameters. It is shown that in the defined limiting case the given theory becomes ordinary quantum mechanics.

"Spectrum of Stimulated Emission of Atomic Iodine on the Hyperfine Structure of the Transition  $^2P_{1/2} - ^2P_{5/2}$  (7603 cm $^{-1}$ )"

Leningrad, Optika i Spektroskopiya, Vol 33, No 2, Aug 72, pp 203-209

**Abstract:** An experimental study is made of the emission spectrum of atomic iodine-127 on the hyperfine structure of the transition  $^2P_{1/2} - ^2P_{5/2}$  in the free emission mode. The emission spectrum from a photodissociation laser was registered in the experiment. A diagram of the experimental installation is given and its operation is described. The results of the measurements showed that of the six components of the hyperfine structure of the spontaneous transition  $5p^2P_{1/2} - 5p^2P_{3/2}$  of atomic iodine, three are realized in stimulated emission: the components 3-3, 3-4, and one of the components 2-1 or 2-2. It is shown that the spectrum is multicomponent in the presence of a magnetic field; the number of components being realized in emission is determined by the amplification factor. By compensating the magnetic fields of the pumping currents, stable single-mode

emission can be achieved without any power loss as compared with multi-component emission. The other components of the hyperfine structure are not realized in emission in the absence of a magnetic field, regardless of the amplification factor, which fact is apparently due to the strong competition between them under these conditions.

"Photodissociative I<sup>127</sup> Laser in a Magnetic Field"

Moscow, Zhurnal Eksperimental'noy i Teoreticheskoy fiziki, Vol 65, No 2 (8),  
1973, pp 524-536

**Abstract:** A study was made of the effect of a magnetic field and also a number of other factors on the kinetics of the radiation spectrum of a photodissociative I<sup>127</sup> laser in the 2 P<sub>1/2</sub>-2 P<sub>3/2</sub> transition. The behavior of the spectrum of the induced radiation was investigated in the presence and absence of a magnetic field, and the superthin splitting constant of the upper operating level of the iodine atom A<sub>1/2</sub> was determined experimentally. A broadening of the luminescence line in the operating transition of the iodine atom during collisions with C<sub>2</sub>F<sub>4</sub>I molecules and also with oxygen and xenon atoms found. Then the corresponding broadening cross sections and the Van der Waals constants were determined for the interaction of the iodine atom with these gases. The calculated values of the frequencies and amplification factors for the most intense groups of Zeeman components were obtained with a varia-

tion explaining the behavior of the induced radiation spectrum with the variation of the magnetic field. The magnitude of the relaxation between sublevels with different  $F$  of the upper operating state  $^2P_{1/2}$  was evaluated.

The study of the spectral composition of the induced radiation in the  $^2P_{1/2}-^2P_{3/2}$  transition of the iodine atom showed that the radiation kinetics of the given laser, which is a complex spectral system, depends on a number of factors such as the magnitude of the magnetic field, the gas pressure in the cell, and the magnitude of the pumping energy. The characteristics of the output radiation of the laser are determined not only by the kinetics of the chemical reactions but also by the structure of the upper and lower transition states, which varies even during the oscillation pulse time. This factor must be considered when constructing various kinetic models of the photodissociative iodine laser. In turn, for a more detailed study of the behavior of the oscillation spectrum in a magnetic field the population kinetics on all sublevels of the investigated transition must be considered.

"Line Width of Stimulated Emission of Atomic Iodine on the Transition  
 $^2P_{1/2}-^2P_{3/2}$ "

Leningrad, Optika i Spektroskopiya, Vol. 33, No. 2, Aug 72, pp 210-213

**Abstract:** An experimental study is made of the width of the line and the mode structure of stimulated emission of atomic iodine-127 on the spontaneous transition  $^2P_{1/2}-^2P_{3/2}$  in a photodissociation laser. It was found that only one of the many possible longitudinal emission modes is realized, regardless of the amplification factor, the presence of a magnetic field, distance between mirrors, or the addition of an inert gas. The emission line width is less than 0.002 Å (35 MHz). The emission line width does not exceed 0.002 Å with addition of an inert gas over a broad range of variation in pressure and amplification factor.

104032q Coefficients of trifluoriodomethane and heptafluoriodopropane diffusion in inert gases. Bogusova, I. M.; Kiselev, V. M.; Kurzenkov, V. N. (USSR). ZH. Fiz. Khim. 1970, 40(2), 402-405. The diffusion coeffs. of the following binary mixts. were studied: He-CF<sub>3</sub>I, He-C<sub>3</sub>F<sub>7</sub>I, Ne-CF<sub>3</sub>I, Ne-C<sub>3</sub>F<sub>7</sub>I, Ar-CF<sub>3</sub>I, Ar-C<sub>3</sub>F<sub>7</sub>I, Xe-CF<sub>3</sub>I, and Xe-C<sub>3</sub>F<sub>7</sub>I. The diffusion, as a function of time, was described by the J. Crank (1956) equation. It was assumed that the diffusion coeff. does not depend on the concn. of the mixts.; however, there is weak dependence. The diffusion coeffs. are of interest for characterizing the diams. of the iodide molcs., the potentials of interaction, and the bond types. L. Holl

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE 2 METHODS PRESENTLY USED FOR  
PROCESSING RESIDUES FROM FURFURAL RECTIFICATION ARE THE RECOVERY OF  
FURFURAL (I) AND METHYLFURFURAL (III) AND DECARBOYLATION TO SYLVAN  
(ALPHA MEHTYL-FURAN). THE METHOD PROPOSED CONSISTS IN OXIDN. OF THE  
RESIDUES WITH H SUB2 O SUB2 TO YIELD ORG. ACIDS. ALSO DEVELOPED WAS A  
NEW METHOD FOR CHEM. ANAL. OF THE RESIDUE, BETTER SUITED FOR INDUSTRIAL  
CONTROL THAN EITHER POLAROGRAPHY OR GAS CHROMATOG. THE METHOD, WHICH  
HAS BEEN DESCRIBED ELSEWHERE (SHAPIRO AND KUL'NEVICH, 1969), IS BASED ON  
UV. SPECTROMETRY AND CALCNS. OF I CONCN. FROM THAT OF A STD. SOLN. AND  
THE OPTICAL DS. OF THE TEST SAMPLE AND THE STD. SOLN. THE AMT. OF  
IMPURITIES ARE DEDC. FROM DIFFERENTIAL SPECTRA. THE ACCURATE METHOD  
MAKES POSSIBLE SEP. I AND II DETNS. EVEN IN STRONGLY RESINIFIED  
MATERIAL. COM. RESIDUES ANALYZED CONTAINED 22-95PERCENT FURALDEHYDES,  
DEPENDING ON THE RAW MATERIAL AND THE I PRODN. METHOD. THEY WERE  
OXIDIZED WITH 30PERCENT H SUB2 O SUB2 AT A MOLAR RATIO OF FURALDEHYDES-H  
SUB2 O SUB2 OF 1:3, A TEMP. OF 64 PLUS OR MINUS 1DEGREE, WITH INTENSE  
MIXING FOR 4 HR. THE QUAL. AND QUANT. COMPNTS. OF THE OXIDN. PRODUCTS  
WERE ANALYZED BY PAPER, COLUMN, AND THIN LAYER CHROMATOG. OXIDN.  
CONVERTED I TO A MIXT. OF CRYST. ACIDS (MALEIC, FUMARIC, AND SUCCINIC).  
II WAS CONVERTED TO BETA ACETYLACRYLIC (III) AND LEVULINIC ACID (IV).  
THE RESIDUAL PEROXIDES WERE DECOMPO. BY TREATMENT WITH THIOUREA  
(1PERCENT BASED ON THE VOL. OF REACTION PRODUCTS). THE CRYST. ACIDS  
(IV) WERE SEPD. BY RECRYSTN. FROM HOT WATER, AND IV BY DISTN. (70DEGREES-5  
MM). IV IS RECOVERED BY EVAPN. OF THE SOLVENT AFTER EKTN.

"Systematic Errors of Pendulum Accelerometers for Random Vibration of the Base"

Novosibirsk, Avtometriya, No 3, 1971, pp 22-26

**Abstract:** During operation of a pendulum on a vibrating base its angle of deflection from the vertical contains along with the variable component, a constant component (drift) defined both by the nature and the parameters of the vibrations and the characteristics of the pendulum itself. The appearance of drift implies additional errors estimated here in the example of a pendulum compensation accelerometer. An approximate method of considering the dynamic properties of the pendulum is described, and the general expression for the drift angle is obtained. A number of limiting and specific cases are considered. The error expressions for two standard autocorrelation functions are presented as an example. The results obtained can be used to estimate the errors and efficiently select the accelerometer parameters for operation under defined vibration conditions.
