277-14. DEFECTS OF LAYERS DURING EPITAXY FROM A SOLUTE IN A MOLTEN

PARTICLE BY V. A. KUZNETSOV, A. G. KAZAKOV, V. I. KUZNETSOV, V. A. HODKOVICH,
ODESSA, November 1, 1971. Symposium on Preparation and Structure of Polymers,
Kharkov, Ukraine, 12-14 June 1971, p. 261

The structural perfection of monocrystallizing layers of semiconductors
is one of the basic properties determining their quality and further
use in the manufacture of instruments.

In this paper a study was made of the formation and fine structure of struc-
tural defects in the monocrystalline layers of boron-nitride, gallium arsenide and
phosphide obtained from a solution in melt of different metals depending on
the conditions of obtaining them.

It was demonstrated that the structural perfection of the monocrystal-
line layers depend on the state of the substrate surface before the subse-
quent, the selection of the melt solvent and the nature of reaction of the
thermal field to the crystallization zone. Some cause of the variation of
the effect distribution with respect to thickness of the epitaxial layer were
discussed.

"Investigating Epitaxy Conditions of Gallium Arsenide"

V sb. Kristallizatsiya i faz. prevrashcheniya (Crystallization and Phase Transformations--collection of works) Minsk, "Nauka i tekhn." 1971, pp 71-79 (from RZh-Fizika, No. 9, 1971, Abstract No. 92397)

Translation: The peculiarities of the oriented growth of GaAs layers from a solution of As in a Ga melt on a GaAs substrate are investigated. A method is developed for obtaining early stages of the epitaxial layers from the solution-melt. An optimal method is selected for processing the substrate surfaces as well as for conditions of epitaxy of the layers with sufficiently perfect crystalline structures and good electrophysical characteristics.

"An Economical Source of Multiply-Charged Ions of Calcium and Zinc"

Moscow, Pribory i Tekhnika Eksperimenta (Instruments and Experimental Technology),
No. 5, Sept-Oct 1970, p 40-44

Abstract: An ion source, illustrated and described in detail, consists of a stainless steel discharge chamber and a molybdenum insert with an emission slit. The chamber, provided with titanium heat isolators, is temperature-controlled by a chrome-alumel thermocouple. The evaporating electrode is mounted on a water-cooled holder in a slender tube between a cathode and plate, just to the side of the discharge path. Adjustable screws move the evaporation surface into the discharge path. Xenon was used as the initiating gas for the calcium, and krypton for the zinc. Argon was also used. When the chamber is cold, a large proportion of the working substance is deposited on the walls, but when the chamber is heated, the substance readily sublimes. The evaporated substance is completely ionized and passes through the slit. A small portion is deposited on the cold parts of the source near the evaporating electrode. Heating the chamber makes it possible to economize on the consumption of the substance. The proposed

p 40-44

cyclotron source is only one of several possible configurations of a hot discharge chamber with a cathode evaporator. The distribution of Cs atoms and ions along the discharge chamber was measured and found to be higher than the distribution in a cold chamber. The authors thank G. M. Solov'yeva for designing the source, I. Duke for technical assistance, and Ye. D. Vorob'yev for supporting the work. Orig. art. has 2 figs. and 4 refs.

"A Ferrovariometer With Magnetic Control"

USSR Author's Certificate No 252415, Filed 9 Sep 67, Published 17 Feb 70 (from
RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10V376 P)

Translation: The proposed ferrovariometer with magnetic control is based on an auto-transformer with a ferrite core and contains an input control winding with magnetization, and an output winding with variable inductance. As a distinguishing feature of the patent, the inductance control range is extended and core cooling is improved by making the core of the ferrovariometer in the form of a set of rectangular ferrite bars with longitudinal openings in which the above-mentioned output winding is located. The output winding is made in the form of segments of hollow copper tubes which are electrically interconnected on the end surfaces of the core.

"The Method of Imaginary Sources in the Hydroacoustic Problem of Describing High-Frequency Acoustic Fields in a Wedge"

Moscow, Akusticheskiy Zhurnal, Vol 18, No 2, Apr-Jun 72, pp 270-276

Abstract: The method of imaginary sources is used to analyze the radiation pattern of a high-frequency field in a wedge. It is shown that a multiply reflected ray in a wedge lies on the surface of an unparted hyperboloid of revolution; the elements of the ray are segments of the straight-line generatrices of the hyperboloid. Each ray leaving the source has its own corresponding hyperboloid. The coordinates of the points of location of the emitter and receiver determine the equations of the hyperboloids for all imaginary sources. A formula is derived for the acoustic field in the wedge in the form of a sum of fields of imaginary sources with regard to the coefficients of all reflections. It is shown that a region exists where beams arrive which have undergone only total internal reflection, so that all imaginary sources appear as bright as the real source. An analogy is drawn between the structure of normal waves (in the Brillouin zone) and the radiation pattern.

"Corrosion Resistance of the Alloys EI-435 and EI-437B in a Mixture of Nitric and Hydrofluoric Acids"

Moscow, Zashchita Metallov, Vol 9, No 3, Jul-Aug 75, pp 437-439.

Abstract: This article studies the influence of concentration, composition and temperature of the solution on the general and intercrystalline corrosion of EI-435 and EI-437B alloys in a mixture of nitric and hydrofluoric acids. The specimens were produced by open induction melting and vacuum-arc remelting. Both general and intercrystalline corrosion of both alloys were observed. The vacuum arc remelted metal corrodes significantly more strongly in all cases and has a significantly higher tendency toward intercrystalline corrosion than the open melted metal. An increase in the concentration of F⁻ ions causes greater general corrosion at all concentrations of nitric acid studied.

Application of Superhigh-Frequency Discharge to Obtain Titanium Nitride Powder

Kiev, Poroshkovaya metallurgiya, No 3, 1972, pp 8-11

Abstract: A description is given of the equipment and the procedure for producing titanium nitride by hydrogen reduction of titanium tetrachloride in a nitrogen current heated in superhigh-frequency heater, reactor, and bubble-type chloride feeder. The overall conversion efficiency of TiCl₄ is as high as 100%. Ammonium chloride is the by-product. The powder obtained is 98% nitride and is close in composition to TiN_{0.95} with a pycnometric density of 5.11 g/cm³. It is finely dispersed and can be sintered at lower temperatures. Experimental sinters of the new powder at 1200-1300°C and low pressures yielded high-strength specimens with 3-5% porosity. It is also readily compactable (three illustrations, 4 bibliographic references).

USSR Author's Certificate No 264794, filed 27 Dec 67, published 2 Jul 70
(from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6A327 p)

Translation: A device is proposed for automatic quantitative and qualitative monitoring of electrical and time parameters. As a distinguishing feature of the patent, in order to reduce time and increase accuracy in localizing trouble spots in cable conductors, the device contains a trouble localizing unit in which the control input of the shift register is connected to the output of the data processing module, while the signal and control outputs of the shift register are connected to the control inputs of the block of output devices and the commutation module respectively. The control inputs of the switches of each of the cells of the high-voltage commutation circuits are connected to the outputs of a two-position storage element whose input is connected to the output of the commutation module through the commutation leads of one of the switches.

"Modeling the Gunn Diode"

Kiev, Izvestiya Vuzov SSSR--Radioelektronika Vol 13, No 3, 1970,
pp 409-412

Abstract: The function of this brief is to set up a model for the Gunn effect, important in functional logic devices, which does not suffer from the defects of earlier models. These defects derive from the use of electromagnetic relays (Carroll & Gablin, "A Low-Frequency Analog for a Gunn-Effect Oscillator," IEEE Trans. on Electron Devices, 1967 ED-14, No. 10, 640). The authors of the communication list those defects as low operating frequency (3 Hz), high triggering currents, high control coil inductance, and the impossibility of modeling a diode of variable cross section.

"Some Characteristics of Atom Segregation in Antiphase Boundaries of Triple Alloys With a Face-Centered Cubic Lattice"

Tomsk, Izvestiya Vysshikh Uchebnykh Zavedeniy--Fizika, No 5, 1973,
pp 18-25

Abstract: This paper examines the theory of the formation of atom segregation at antiphase boundaries of the {111} type in ternary alloys with face-centered cubic lattices. The interaction of the atoms in the first two coordination spheres is taken into account in this investigation into the effect of the size of the domains and the relationships between the atomic interaction energies on the extent of the segregations. It is assumed that the effect of antiphase boundary erosion can be neglected. The authors begin their analysis with the equation for the energy configuration per unit volume of the triple alloy and the expression for the configuration part of the entropy. Analysis of the equations of the solution derived in the article showed that the density of the antiphase boundary has little effect on the amount of segregation. It was 1/2

"On the Effect of the Nozzle's Diameter on the Injection Ratio of GBP Type Burners"

Nauch. tr. Omsk. in-t inzh. zh.-d/ transp. (Scientific Works of the Omsk Institute of Railroad Transportation Engineers), Vol 142, 1972, pp 17-19 (from Referativnyy Zhurnal -- Teploenergetika, No 3, 1973, Abstract No 3F93 by V. A. Speysher)

Translation: The authors conducted experimental and theoretical investigations of the dependence of the injection ratio (U) of type GBP-140 panel burners, with full preliminary mixing, on the diameter of the gas nozzle (d) for various gas pressures (p_g). It is a well known fact that when p is constant, a reduction in d causes an increase in U . However, in order to insure that a furnace's heating power remains constant when the number of burners remains the same and d is reduced, it is necessary to increase p_g accordingly, so that the gas flow rate remains unchanged. These factors exert contradictory effects on U , which causes the effect of each of them to be weakened. As a result of their experiments, the authors established that a reduction in d (from 3 to 2.4 mm) can increase U somewhat. If a furnace's heating power is controlled this way, additional
1/2

USSR

KAPUSTIN, A. M., et al., Nauch. tr. Omsk. in-t inzh. zh.-d. transp. Vol 142, 1972, pp 17-19

burners should be used. In the case where the number of working burners remains constant and a stable thermal state is maintained in the furnace, reducing d while simultaneously increasing the value of p_g will not cause any noticeable increase in U. (2 illustrations; 3 bibliog.ref.)

"An Imitator of Meteoric Radar Signals"

Radiotekhnika. Resp. zhzhved. nauch.-tekhn. sb. (Radio Engineering. Republic Interdepartmental Scientific and Technical Collection), 1971, vyp. 12, pp 38-40 (from RZh-Radiotekhnika, No 7, Jul 71, Abstract No 7G51)

Translation: This paper discusses development of a simulator designed for checking whether the units and modules of radar installations are functioning properly, and for imitating various characteristics of reflections from meteor trails. A description is given of an imitator which can be used to simulate Doppler frequency shift of a coherent pulse radar, and the time of existence of a reflection from a meteor trail. The Doppler frequency shift is simulated by means of two frequencies whose difference can be varied. The problem of obtaining the two frequencies is solved by the method of successive frequency displacement with splitting into two frequency channels. A block diagram of the simulator is presented and described. One illustration. Resumé.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN VIEW OF THE FACT THAT UP TO THE PRESENT TIME THERE EXISTS NO SATISFACTORY METHOD OF INDUCING HEPATIC COMA THE AUTHORS CARRIED OUT THREE PRINCIPAL SERIES OF EXPERIMENTS: 1. DEVASCULARIZATION OF THE LIVER WITH PRELIMINARY ESTABLISHMENT OF PORTOCAVAL ANASTOMOSIS. 2. INJECTION OF HEPATOTROPIC POISON (CARBON TETRACHLORIDE) INTO THE BLOOD CHANNEL. 3. LIGATION OF THE HEPATIC ARTERY, BILE DUCTS WITH INTRODUCTION INTO THEM OF CARBON TETRACHLORIDE. EXPERIMENTS WERE CONDUCTED 47 MONGREL DOGS UNDER MORPHINE HEXANAL ANESTHESIA. THE DEVELOPMENT OF HEPATIC INSUFFICIENCY WAS EVALUATED BY THE CLINICAL COURSE, BIOCHEMICAL INDICES OF THE BLOOD (AMMONIUM, UREA, SUGAR, BILIRUBIN, LACTIC ACID) AND MORPHOLOGICAL STUDY OF THE LIVER. THE AUTHORS ARRIVED AT THE CONCLUSION THAT THE MOST COMPLETE SYMPTOM COMPLEX OF ACUTE HEPATIC INSUFFICIENCY IN DOGS WAS OBTAINED ONLY IN THE THIRD SERIES. AMMONIUM TOWARDS THE 3RD-5TH DAY INCREASED UP TO 1.8 PLUS OR MINUS 0.13 MGPERCENT (P SMALLER THAN 0.02); UREA DECREASED DOWN TO 19.0 PLUS OR MINUS 0.73 (P SMALLER THAN 0.02); BILIRUBIN UP TO 2.4 PLUS OR MINUS 0.003 (P SMALLER THAN 0.001); LACTIC ACID INCREASED UP TO 57.0 PLUS OR MINUS 0.001; SUBSEQUENTLY THE BIOCHEMICAL INDICES STEADILY DETERIORATED. THE CLINICAL PICTURE AND SEVERE MORPHOLOGICAL AFFECTION OF THE LIVER SUPPLEMENTED THE BIOCHEMICAL INDICES OF THE BLOOD. "Effect of Adsorption on Kinetics of the Ekoelectronic Emission"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 47, No 6, Jun 73, pp 1578-1579

Abstract: Exoemission of tin and zinc subjected to deformation by tension and rupture under vacuum (up to $2 \cdot 10^{-6}$ torr) was studied. The emission was stimulated by α mercury lamp, the rate of deformation was $4.24 \cdot 10^{-4} \text{ sec}^{-1}$. The experiment was based on the cyclic increase of pressure in vacuum from $2 \cdot 10^{-6}$ to $5 \cdot 10^{-4}$ torr. After rupturing the tin samples at $5 \cdot 10^{-4}$ torr some increase in emission was observed, followed by a gradual decrease in the emission intensity. When the vacuum was increased twofold, the emission at first decreased, then reached a maximum and decreased again. Similar phenomena were observed in the case of zinc, but decreases and increases were of much high magnitude. This behavior of emission is attributed to adsorption processes. Filling the vacuum chamber with air to $5 \cdot 10^{-4}$ torr pressure facilitated the adsorption process and it was accompanied by an intensive exoemission. If samples were held at this pressure for ~ 1 min., several increases and decreases in the exoemission were observed; however, during 1/2

USSR

BOGACHEV, I. N., et al., Zhurnal Fizicheskoy Khimii, Vol 47, No 6, Jun 73,
pp 1578-1579

the second increase in pressure, the kinetics of exoemission was not influenced much in the case of zinc but facilitated a more rapid decrease of the exo-emission for tin. This indicated the irreversible nature of the emission process.

"Clinical Course of Influenza Treated With Interferon and Symptomatic Agents"

Moscow, Klinicheskaya Meditsina, No 2, 1973, pp 117-119

Abstract: The clinical course of influenza was much milder in patients treated solely with concentrated leukocytic interferon than in a matched group treated with conventional symptomatic drugs. Interferon treatment was administered 4 days: 2 drops (= 200 units) instilled in each nostril the first and second days of the disease every other hour and the same amount on the third and fourth days 5 to 6 times a day. Total interferon used was 4 to 6 ml. In these patients, the symptoms of intoxication were less pronounced than in controls and they lasted 2.4 days compared to 3.8 days while chills persisted 1.1 and 2.6 days, respectively. Body temperature returned to normal on day 2 or 3 of the disease compared to day 4 or 5 in those treated with symptomatic drugs. The EKG changes too were less pronounced in the patients given interferon. Interferon did not produce side effects or complications nor did it prevent the formation of type-specific antibodies.

"Optimizing Measurements of Interference Parameters"

Moscow, Radiotekhnika, Vol 27, No 7, Jul 72, pp 61-67

Abstract: Let $\theta' = (\theta_1, \dots, \theta_n)$ be unknown interference parameters. To determine the optimum structure of an instrument for measuring the multidimensional parameter θ it is necessary to know the statistical properties of the interference and the cost function $C(\hat{\theta}, \theta)$ which characterizes losses due to deviation between the estimated value $\hat{\theta}$ and the actual value θ . In this paper $C(\hat{\theta}, \theta)$ is determined from the influence of measurement errors on the quality of a receiver which isolates a signal against a background of noise. From this is found the optimum structure of an instrument for measuring θ at minimum measurement cost.

Last 1 March, Moscow, 17-17 June 1972, p. 211

DISCUSSION. Previous papers were given at temperatures of $\sim 1000^{\circ}\text{C}$ to 1200°C on silicon with linear dependence. Measurements of two types were found in this paper. One type in the substrate starting the epoxide and pervious to layers; there density does not depend on the temperature T . The latter are more prominent on the film-substrate boundary and are discussed elsewhere [11]. Their density decreases exponentially with an increase in temperature and linearly with a decrease in growth rate of the layer V . The activation defect density does not depend on the temperature and is the same ($2-3 \times 10^{15} \text{ cm}^{-2}$) of the layers, irreversibly. The dependence of the concentration N on the additions A , $N = N_0 + N_1 A$ in the layers or the concentration N in the source is described by the formula $N = A \exp(AM/V) \exp(-A_1 T)$ ($A = 10^3 \text{ cm}^3/\text{mole}$, $A_1 = 10^3 \text{ K}^{-1}$), and $N_1 = 75 \text{ holes}/\text{cm}^2$. In the case of phosphorus, $A = 10^3 \text{ cm}^3/\text{mole}$. The dependence of N on V was investigated in this same way for all additions.

"Use of Interferon in the Treatment and Prevention of Viral Dermatoses"

Moscow, Vestnik Dermatologii i Venerologii, No 9, 1971, pp 14-17

Abstract: Good results were obtained from using interferon to treat 201 patients (5 to 70 years of age) with various viral dermatoses. Instead of lotions, ointments, etc. containing interferon, these three methods were used: (a) superficial traumatization of the skin with interferon applied to warts, papillomas, and some condylomas; (b) injection of a solution of interferon (1000 units in 1 ml of sterile distilled water) into the affected tissues in the case of herpes simplex, warts, and molluscum contagiosum; (c) iontophoresis for various forms of dermatoses. The particular mode of treatment was chosen in relation to the dermatosis, its site, and age of the patient. There were no side effects and recurrences were comparatively few.

V sb. Obnaruzh. i raspoznavaniye. Planir. eksperimentov (Detection and Recognition. Planning of Experiments--collection of works), Moscow, "Nauka", 1970, pp 11-18 (from RZh-Kibernetika, No 1, Dec. 70, Abstract No 1V150)

Jan 71,

Translation: Let us represent the observed process $X(t)$ in the form

$$X(t) = f_s[s, n; \theta]. \quad (i)$$

where f is a predetermined function, $s(t)$ and $n(t)$ are random processes and θ is "a variable parameter of the situation, which describes the indefiniteness" of the given model (this type of model of the observed process is useful for instance in studies of communications systems). In this paper the authors examine problems of constructing invariant resolving devices for detecting or isolating the process $s(t)$. A resolving function $\Phi(x)$ is called "invariant to the parameter θ " if for any s and n its value d is independent of the value of the parameter θ . Invariant resolving functions of this type form a class of functions $\Phi[T(x)]$ of the maximum invariant $T(x)$

"Investigation of Neutralization of an Intense Ion Beam by a Numerical
Method"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol 43, No 10, Oct 73, pp 2178-2181

Abstract: Numerical solution of a system of equations of a self-consistent field is used to study neutralization of the space charge of an ion beam by introducing electrodes. The changes in configurations of transverse phase volumes of the electron and ion components lengthwise of the beam are considered. The values found for the radial potential differential in a neutralized beam are compared with the results of approximate calculation. The experimentally observed increase of electron temperature in the beam is confirmed and explained.

"Proton Beam With an Impulse of Up to 70 Gev/s Elastically Dispersed Inside a
Target"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol 42, No 7, 1972, pp 1437-1445

Abstract: This paper discusses the operation of a channel built into the French liquid-hydrogen Mirabelle chamber for the accelerator of the Institute of High-Energy Physics (IFVE). The function of the channel is to form pure beams of pi and k mesons, and antiprotons, in a broad range of impulse magnitudes under the action of a high-frequency separator. The secondary particles are generated on the inside of a target placed in the path of a proton beam diverted from the accelerator with an energy of 70 Gev. By using a fast system for aiming the proton beam at the target, together with a kicker magnet in the channel, the required number of particles passing through the chamber can be provided. The optical system of the channel is described with the

"Calculation of Phase Focusing of Intensive Bunches of Charged Particles in
Direct-Action Accelerators"

Moscow, Atomnaya Energiya, Vol 32, No 5, May 72, pp 437-440

Abstract: The study of particle dynamics in direct-action accelerators requires consideration of the Coulomb interaction of particles in a bunch, as well as the velocity spread of the particles. Such a problem is complicated to solve in a full volume, since the particle motion has to be considered in a six-dimensional coordinate and velocity space. To simplify the problem, it is assumed that the longitudinal motion of the particles of the bunch does not depend on their radial coordinates, nor the radial motion of the particles on their axial coordinates. It is also assumed that the particle density distribution in the transverse phase space is microcanonical and at a given moment of time is the same for any cross-section of the bunch $z = \text{const}$. These assumptions permit reducing the six-dimensional problem of the phase

1/2

USSR

AVRAMENKO, M. I., et al., Atomnaya Energiya, Vol 32, No 5, May 72, pp 437-440

focusing of a bunch to a two-dimensional problem concerning the longitudinal coordinates and velocities of particles. The article considers a nonstationary case. No constraints are imposed on the particle density distribution function in the longitudinal phase space. A description is given of the calculation method used to study peculiarities of the formation of intensive bunches of nanosecond duration in direct-action accelerators. A diagram is given showing successive variations in the configuration of the longitudinal phase volume, the linear charge density distribution, and the longitudinal Coulomb repulsive force along a bunch during passage through an accelerator. It is shown that, due to the nonlinearity of the longitudinal Coulomb forces, the configuration of the longitudinal phase volume of the bunch is considerably distorted, which phenomenon limits the bunching factor.

"Phase Focusing of Intense Ion Bunches of Nanosecond Duration"

Moscow, Elektrofizicheskaya Aparatura, No 9, 1971, pp 63-68

Abstract: The formation of intense ion bunches with a duration of 1-5 ns in direct-action accelerators has aroused a good deal of interest recently. This article presents a method of computing the parameters of such bunches of ellipsoidal form, in drift space and in a uniform electrical field of the accelerator tube, in the presence of initial velocity modulation. The ellipsoidal formation is obtained in accelerators with a discontinuous system of a constant beam and a buncher between the ion source and the accelerator tube. Situations in which the axial semiaxis of the bunching is greater or less than the radial semiaxis are considered. It is shown that if the intensity of the uniform electric field satisfies the condition $E \ll U_0/a_0$, where U_0 is the potential at the input of the accelerator tube and a_0 is the length of the axial

1/2

- 92 -

"Measurement and Investigation of the Redistribution of the Phase Density of Charged Particles in Real Fluxes"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol XLI, No 8, 1971, pp 1611-1617

Abstract: The density distribution of the charged particles of a beam in a four-dimensional phase space of transverse coordinates and velocities determines all the basic characteristics of the flux. The authors' actual measurements of this distribution for proton beams with a current of approximately 400 milliamperes and particle energies of 30 and 650 kiloelectron volts showed that the actual distribution of charged particles differs substantially from the distribution as it is usually calculated theoretically. Most methods of computing the parameters of intensive fluxes assume a microcanonical distribution in which the phase density of the particles does not change from one cross section of the beam to another. In actual fact, the phase density of the particles does change and, consequently, so do such basic characteristics of the flux as the density distribution of the current and the magnitude and configuration of the phase volume.

"Intense Beams with an Arbitrary Distribution of the Phase Density in External Focussing Fields"

Leningrad, Zhurnal Tekhnicheskoy Fiziki; October, 1970; pp 2099-2105

ABSTRACT: A method of obtaining beams with an arbitrary distribution of the phase density, developed by the authors in previous works appearing in earlier issues of the same journal (XXXVII, No. 5, 1967; XXXVIII, No. 2, 1968; XXXVIII, No. 10, 1968), is generalized for the case of the presence of external magnetic and electrical fields. Conditions are presented and formulated under which the general, stationary, six-dimensional problem on the determination of the distribution of the particle density in phase space can be reduced to a non-stationary, four-dimensional problem. Results of actual calculations illustrating the basic properties of beams with a distribution of the phase density different from the microcanonical are presented. In particular, it is shown that in such beams the projection of a four-dimensional phase space on the plane of cartesian coordinates x, x^i may become larger.

"The Task of Constructing All Samples in Order of Nondecreasing Weight"

Moscow, Avtomatika i Telemekhanika, No 6, Jun 71, pp 138-143

Abstract: This article describes a method for going from an implicit descriptive specification of a certain finite set M to a specific designation of all its elements. Basically, the method consists of the following steps: 1) definition of the relationship of order over the set M ; 2) selection of the first (least) element of M ; 3) selection of the succeeding element for any $a \in M$: that is, selection of the first element in the set $M_a = \{x / x \in M, a < x\}$. This approach is based on the structure of an ordered set which consists of a chain $a_1 < a_2 < \dots < a_m$, where a_1 is the first or least element in M and where a_{i+1} is the element which follows a_i ($i = 1, 2, \dots, m-1$). This method has the advantage of requiring storage of only the last element obtained in the process of constructing the set rather than all previously obtained elements, which procedure saves storage space. Furthermore, the method saves time by not requiring the construction of extraneous elements. As an illustration, the method

1/2

USSR

KUZNETSOV, V. S., Avtomatika i Telemekhanika, No 6, Jun 71, pp 138-143

is applied to the problem of constructing all possible samples of a set in the order of nondecreasing weight, where the weight of a sample is taken to be the sum of the weights of the elements comprising it.

244368 SPRING SHEET GRAB/STACKER comprises a rotary frame (1) slotted for the plates (2) each with magnet (3), bolts (4) and spring (5) to soften impact when lowered on to the sheets. The fourth plate is linked to a ram (6) and carries two bars (7) with nuts (8) for setting the required sheet set-down pitch. All plates are linked by a parallelogram (9). The stacker is placed so that the plate magnets contact the spring sheets, are energised and lift the sheets to where the ram is cut in which spreads the sheets on the plates by the required pitch and so lay these on the hearth conveyor once the magnets are de-energised.

"Elastic-Plastic State of a Thick Plate with an Elliptical Aperture Under the Influence of Internal Pressure"

Izvestiya Vysshikh Uchebnykh Zavedeniy, Mashinostroyeniye, No 11, Nov 73,
pp 12-17

Abstract: This work studies the elastic-plastic stress and strain state of an infinite plate with an elliptical aperture under conditions of planar deformation, with even pressure p acting around the contour of the aperture. With a sufficiently high value of pressure, an area of plastic deformations arises by the aperture. It is assumed that at the moment of appearance of the plastic area, it coincides with the contour of the aperture, while under further loading, at any moment the plastic zone fully contains the plastic zone from any previous moment of loading. The work uses the method of the small parameter for approximate solution of elastic-plastic problems. Two approximations are found for stresses and strains in the elastic and plastic areas, as well as two approximations for the boundary separating the elastic and plastic areas.

Novosibirsk, Avtometriya, No 5, Sep-Oct 73, pp 78-79.

Abstract: This article presents the results of experiments on SHF holography in the centimeter waveband, in which an improvement is achieved in the quality of images produced by some improvements in the circuit for electronic processing of the signals received, to achieve linearity of recording of the signals on the photographic material. The maximum Rayleigh resolution, defined by the geometry of the equipment was 2.7 cm. Indeed, bands separated by 30 mm are clearly shown as separate bands in the photographs presented with the article.

"Concerning the Structure of a Weak Shock Wave in a Gas-Liquid Medium"

Moscow, Doklady Akademii Nauk SSSR, Vol 207, No 2, 1972, pp 313-315

Abstract: Experiments were done as a qualitative check on theoretical concepts of a shock wave propagating in a liquid containing gas bubbles. The piezoelectric method of measurement was used to investigate the structure of the shock wave front. The LKh609 pressure gauge was used with frequency independence from 20 to 50 kHz and sensitivity of 6.3 V/bar. Nitrogen was blown into the liquid through a porous plate at the lower end of a transparent plastic tube 6 cm in diameter and 100 cm long. Signals from pressure gauges on the inner walls of the tube were sent to a cathode-ray oscilloscope. It was found that increasing the intensity of the shock wave increases the frequency and relative amplitude of oscillations in the shock wave front. Reducing the bubble diameter increases the frequency and reduces the ampli-

tude of oscillations in the shock wave front. Pressure oscillograms of the
shock wave front in a gas-liquid mixture with artificially increased vis-
cosity show a monotonic pressure profile, which confirms the theoretical
conclusion of a nonoscillating process in this case.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE EFFECT OF A TRANSVERSE ELECTRON BEAM ON THE OUTPUT POWER W OF A CO SUB2 PULSED LASER WAS STUDIED BY MEASURING W OF THE LASER AS A FUNCTION OF CO SUB2 PRESSURE AT A CONST. DISCHARGE VOLTAGE (2 KV) AND THE PULSE DURATION (X1-21 TIMES 10 PRIME6 NEGATIVE SEC) WITH AND WITHOUT THE ELECTRON BEAM (0.5 MEV, SIMILAR TO 5 A, AND 2 TIMES 10 PRIME6 NEGATIVE SEC PULSE DURATION) APPLICATION AND WITH AND WITHOUT THE ADDN. OF XE, AG, NE, HE, AND N. IN PURE CO SUB2 AND DISCHARGE WITH AND WITHOUT THE APPLICATION OF THE ELECTRON BEAM, A STABLE GENERATION WAS OBSD. AT LESS THAN OR EQUAL TO 30 TORR. AT GREATER THAN 30 TORR, THE GENERATION WAS UNSTABLE. A MAX. W WAS OBSD. AT 8-10 TORR. IN BOTH CASES (WITH AND WITHOUT ELECTRON BEAM APPLICATION) W INCREASES LINEARLY WITH CO SUB2 PRESSURE, BUT THE INCREASE WAS MARKEDLY HIGHER IN THE PRESENCE OF THE ELECTRON BEAM. THE RATIO OF W WITHOUT THE ELECTRON BEAM TO W WITH THE ELECTRON BEAM INCREASES WITH PRESSURE FROM 1 TO 2.5-3. THIS RATIO WAS MARKEDLY HIGHER IN THE PRESENCE OF XE OR AG. THE ADDN. OF NE, HE, OR N HAVE PRACTICALLY NO EFFECT ON THE LASER GENERATION. THE MARKED INCREASE IN THE OUTPUT POWER OF THE CO SUB2 LASER WITH THE APPLICATION OF AN ELECTRON BEAM IS ATTRIBUTED TO THE EFFECT OF THE ELECTRON BEAM ON THE ELECTRON ENERGY DISTRIBUTION FUNCTION.

"Effect of Steepness of the Peak of an Obstacle on the Diffraction Attenuation"

Tr. Buryatsk. in-ta estestv. nauk, Buryatsk, fil. Sib. otd. AN SSSR (Works of Buryatsk Institute of Natural Sciences. Buryatsk Branch of the Siberian Division of the USSR Academy of Sciences), 1970, vyp. 6, 1970, pp 84-91 (from RZh-Radio-tehnika, No 8, Aug 70, Abstract No 8A276)

Translation: It is demonstrated in the Kirchhoff approximation that the effect of steepness of a diffracting peak is exhibited in the form of the functions $f_1(a\theta^3/\lambda) \cdot f_2(a\theta^3/\lambda)$ which are multiplied by the attenuation factor of an opaque halfplane with an effective height of enclosure equal to the height of enclosure of the obstacle. Analysis of the limit of applicability of the approximate formula obtained showed that it is suitable for calculating mountain routes in the meter and decimeter ranges of microwaves. There are two illustrations, one table and a three-entry bibliography.

"Concerning Some Peculiarities of the Behavior of Elastic Systems With Cracking Under the Effect of Dynamic Loads"

Tr. Mosk. aviats. in-ta (Works of Moscow Aviation Institute), 1971, vyp. 237, pp 3-24 (from RZh-Mekhanika, No 7, Jul 72, Abstract No 7V267)

Translation: Solutions are found for problems on determination of critical loads for a Mises girder and a mildly sloping elastic arch under various types of dynamic loading. In this connection, the Mises girder is treated as a system with one degree of freedom, and the arch is treated as a system with two degrees of freedom. The critical load is taken as that external force which puts the system into motion such that it reaches deflections corresponding to an unstable trajectory on the phase plane at zero velocity. On this basis, the value of the critical load P_{cr} is determined from the condition of equality between the work of external forces and the potential energy of deformation of the system. A graphic method is used to find P_{cr} . Numerical integration of the equation of motion confirmed the admissibility of the proposed approach to solution of problems of this kind. V. B. Silkin.

Kiev, Fiziko-Khimicheskaya Mekhanika Materialov, Vol. 7, No 5, 1971, pp 68-71

Abstract: It was observed that the heat resistance of the UMB-4c packing material operating in gas turbines is higher than under laboratory conditions in air. This is believed to be due to the more corrosive action of air which contains more oxygen than the products of combustion of aviation fuel.

In order to simulate the actual conditions in the gas turbine an apparatus was used where the material was tested in the atmosphere of gas having essentially the same chemical composition as the products of combustion of aviation fuel.

"Effects of Spontaneous Radiation in High-Amplification Lasers
With Wavelength of 3.39 Microns"

Tr. Mosk. fiz.-tekhn. in-ta (Transactions of the Moscow Physico-
Technical Institute) 1971(1972), pp 82-91 (from RZh---Fizika, No 4,
1973, Abstract No 4D1234)

Translation: The effect of spontaneous radiation on the characteristics of a coherent light amplifier with a high amplification factor is considered. It is shown that the linear mode of amplification is determined by the condition of smallness of the external signal compared with the amplified spontaneous radiation in each point of the amplifier. A computation is made of the distribution of the characteristics of the active medium for the case of the comparable quantities of uniform and nonuniform broadening of spectral lines. Relationships are given for the amplification factor along the tube length for various lengths of the amplifier and for the amplification spectrum. Results of the computation are compared with the experimental data obtained for a He-Ne laser (3.39μ). Ye. A.

"Nonlinear Interaction of a Spontaneous Radiation Field With the Active Medium of a Gas Laser With High Amplification"

Gor'kiy, Izvestiya VUZ--Radiotekhnika, No 10, 1972, pp 1486-1492

Abstract: The spontaneous radiation of laser quantum amplifiers, abnormally high where the amplification is high, is explained by its nonlinear interaction with the active medium. The result is nonuniform density distribution of the inverse population and thus a reduction in the amplification factor and distortion of the frequency characteristic. The purpose of the present paper is to investigate theoretically the phenomenon of the spontaneous radiation field interacting with the laser medium on the basis of the semi-classical method. The results of a numerical calculation of the problem on the computer for a laser using a He-Ne mixture and operating at a wavelength of 3.39 microns are also presented. The analysis begins with a system of equations describing the parameter distribution of the laser, using a simple model of the device in which the spontaneous radiation field is considered as a set of 1/2

USSR

KOZEL, S. M., et al, Izvestiya VUZ--Radiofizika, No 10, 1972,
pp 1486-1492

noncorrelated plane waves propagated along the laser axis, with an attenuation factor to account for the angular dispersion of the field and the multiple reflections from the walls. It is noted that neglecting this interaction between the spontaneous radiation and the medium may lead to substantial errors in computing the laser characteristics and in the treatment of experimental results. The authors express their thanks to A. S. Gorinov for the computations and to I. P. Mazan'ko and A. V. Shelagin for their useful comments.

"Synthesis of Diallyl Ethers of Arylphosphoric Acids"
Moscow, Plasticheskiye Massy, No 10, 1970, pp 16-17

Abstract: The synthesis was carried out in two stages. First phosphorus oxychloride was reacted with substituted phenols to yield phenylphosphoric acyl dichlorides. Next these dichlorides were condensed with allyl alcohol. The acyldichlorides were obtained at refluxing temperature, with continuous stirring. The temperature was elevated to 150°C after 4 hrs and kept there for one hour. A double distillation gave final products in 54-61% yield. Next step was carried out by mixing the dichlorides with allyl alcohol and pyridine at 0°C. The reaction was carried out at the refluxing temperature. A triple redistillation gave the products in 18-54% yield -- colorless or yellowish liquids rapidly darkening on storage in light; they were soluble in many organic solvents.

Abstract: The authors describe synthesis of chloride and allylaryl esters of methyl-, chloromethyl- and β -chloroethylphosphonic acids. The synthesis was done in two stages. In the first stage, methyl-, chloromethyl- and β -chloroethylphosphonyl dichlorides are interacted with phenols to produce the corresponding acid chloride esters. The second stage is interaction of the acid chloride esters with allyl alcohol in the presence of pyridine. The synthesized substances are colorless liquids which dissolve in organic solvents.

"Machine Graphing and Its Applications"

Mashinnaya Grafika i yeye Primeneniye [English version above], Novosibirsk, 1973, 123 pp (Translated from Referativnyy Zhurnal Kibernetika, No 10, 1973, Abstract No 10V703K)

Translation: This collection is dedicated to problems of the utilization of computer plotters in problems of automation of scientific and planning-design studies. The term "machine graphing" here refers to the complex of mathematical methods, algorithms and programs used to process and subsequently output information on computer graphic devices. The most common such devices at the present time are graph constructors (frequently called plotters) and devices which output information onto cathode ray tube screens (photoconstructors, displays, etc.).

All articles published in the collection were based on works performed at the Laboratory of Machine Graphics of the Computer Center, Siberian Affiliate, Acad. Sci. USSR in 1969-1972. These works can be arbitrarily divided into three groups as to their content, corresponding to the order of placement of articles in the collection.

The first trend consists in the development of universal software, which is to allow programmers to use graphic devices at the level of the

1973, 123 pp

qualified mechanical draftsman. The second trend is related to the crea-
tion of various specialized programs for the representation of various
specific types of graphic information.

The third supplementary trend is the development of mathematical
methods of processing and preparation of data for subsequent graphic
representation.

"Synthesis of an Impedance Realizing a Specified Directional Diagram"

Dnepropetrovsk, V sb. Vopr. teorii i tekhn. avtomat. sistem (Problems in the Theory and Technology of Automatic Systems--collection of works) 1971, pp 97-105 (from RZh--Radiotekhnika, No 10, 1972, Abstract No 10B6)

Translation: The plane problem is considered of synthesizing an impedance which, for a known directional diagram of a primary radiator, permits obtaining the specified diagram in the presence of a metal body. An expression is obtained for the distribution of the impedance along the antenna. Results are given of the computation of the impedance distribution. Two illustrations, bibliography of three. V. S.
