"Pollution of Soil and Fruits by Copper-Containing Pesticides"  
Moscow, Gigiena i Sanitariya, No 1, 1970, pp 108-110

Abstract: Field experiments showed that spraying an apple orchard with cuporsan or Bordeaux mixture markedly increased the amount of copper in the soil. Before spraying, the copper content was 7-8 mg/kg, whereas after spraying with a 0.6% cuprosan suspension, the copper concentration increased markedly, reaching a value of 18 mg/kg in the 0-30 cm layer; after spraying with a 1% Bordeaux mixture, 14.2 mg/kg. These pesticides had a similar effect on the soil of vineyards. Copper accumulation in the soil during the growing season was 12 to 25 mg/kg above the control level in the 0-18 cm layer. The behavior of the compounds was largely dependent on the type of soil and its physicochemical properties, the amount of humus, moisture, etc. The concentration of copper in apples treated with a 0.6% cuprosan suspension (30.75 mg of copper per hectare) and 1% Bordeaux mixture

pp 108-110

(18.75 kg of copper per hectare) was 5.10 and 4.16 mg/kg, respectively, compared with a maximum of 0.93 mg/kg in apples picked on the control plot. The copper content of grapes sprayed with the pesticides varied with the amount applied per unit of area and depended on the concentration of copper in the soil. Study of the effect of the pesticides on the soil microflora showed that the bacterial population in the soil of the experimental plots was 18.5-79% of that in the control.

"Effect of Technological Factors on Desulfurization of Metal in Large Open-Hearth Furnaces"

Novokuznetsk, IzVUZ-Chernaya Metallurgiya, No 6, 1971, pp 59-62

**Abstract:** For the purpose of studying the process of metal desulfurization in 650-ton open-hearth furnaces and refining the character of the effect on its technological factors (composition of slag, consumption of ore and limestone, etc.) data from 400 heats of steels St 3sp and 15R2S were analyzed. Results of the analysis confirmed the conclusion that the one factor having the greatest effect on the desulfurization of metal is the basicity of the slag. This was determined using equations expressing the distribution of sulfur between the slag and metal. Optimal values of slag basicity (almost 2.7) and the rate of its growth (almost 0.8 liters/hr), the increase of which did not lead to any significant improvement of metal desulfurization, were established. In the existing technology of reducing 650-ton heats and the intensity of blowing the bath (4.5-6.0 m<sup>3</sup>/ton-hr), the optimum consumption of limestone in this period is 12-14 tons (1.9-2.2% of heat weight). Magnitude of the ratio %FeO/%CaO = 0.3 provides a good assimilation of limestone and the best conditions for lowering sulfur content in the metal. Three figures, 3 bibliographic references. 1/1

"Effect on Liquid Steel Output of Certain Parameters of Oxygen Blowing Into a  
High-Capacity Martin Furnace Bath"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promstvennost', No 5, Sep-  
Oct 70, pp 10-12

Abstract: A study was made of the effect of certain parameters of oxygen blowing into a steel bath (blowing rate, oxygen concentration in the blowing-through mixture, melting time, total expenditure of oxidizers, etc.). The oxygen blowing rate substantially affects the liquid metal output, so that there is an increase in metal losses in the form of oxides and regulus in the slag and as dust in the combustion products. The relationship between the blowing intensity and metal losses is expressed by a formula established from data on more than 300 melts. It follows from this formula that every 1000 m<sup>3</sup>/hr increase in blowing rate reduces the liquid metal output by 1.2%. This may be compensated by reducing the melting time and oxygen concentration in the blowing-through mixture.

1/2

USSR

MEDZHIBOZHSKIY, M. Ya., et al, Metallurgicheskaya i Gornorudnaya Promyshlennost', No 5, Sep-Oct 70, pp 10-12

A reduction in oxygen concentration from 95 to 65% at a 3000 m<sup>3</sup>/hr average blowing rate increased the liquid steel output by 1.7%. Figures show the dependence of liquid steel output on oxygen purity, melting time, specific oxygen flow rate and total expenditure of oxides. A table shows results of a series of experimental meltings conducted with the purpose of determining the metal losses in the form of dust and slag particles.

"Motivating Factors in Leptospirosis Epidemics in Western Siberia: a Review of the Literature"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 10, 1972,  
pp 87-91

Abstract: Natural foci of leptospirosis embrace the tundra, forest-tundra, forest, forest-steppe, steppe, and Altay-Sayan mountain zones of Western Siberia where rodents are the main carriers of the pathogen, and most epidemics have originated. However, the situation changed during the last 10 years because of the mechanization of agriculture, development of livestock raising, and rapid industrialization. Numerous outbreaks have occurred among the inhabitants of new cities and settlements chiefly as a result of drinking or swimming in the water of small rivers and ponds contaminated by the excretions of infected cattle. The article includes two tables, one showing the etiological structure of leptospirosis among farm animals (by landscape zone, animal species, and leading serotypes isolated) and the other showing the immunological structure of the local population (by landscape zone, leading serotypes isolated, and number of positives in the agglutination-lysis test).

"Synthesis of Some Neptunium (VI) and Uranium (VI) Sulfates"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 17, No 5, May 72, pp 1423-1425

Abstract: Complex sulfates of hexavalent neptunium and uranium were prepared from aqueous solutions of the starting materials. Following complexes were isolated:  $K_2NpO_2(SO_4)_2 \cdot 2 H_2O$ ,  $Cs_2NpO_2(SO_4)_2$ ,

$Cs_2(NpO_2)_2(SO_4)_3$ ,  $[Co(NH_3)_6]_2NpO_2(SO_4)_4 \cdot n H_2O$  ( $n = 5$  or  $8$ ),

$[Co(NH_3)_6]_2UO_2(SO_4)_4 \cdot n H_2O$  ( $n = 5$  or  $8$ ),  $[Co(NH_3)_6]_2(UO_2)_2(SO_4)_5 \cdot 6H_2O$ ,

$[Co(NH_3)_6]_4Cs_6[UO_2(SO_4)_4]_3 \cdot 8 H_2O$ .

It has been established that the bond strength of neptunium and uranium with the  $SO_4^{2-}$  groups increases when the  $Co(NH_3)_6^{3+}$  ions are partially substituted in the internal sphere with the  $Cs^+$  ions. The bond strength of oxygen with

"Heptavalent State of Transuranium Elements. IX. New Methods for Obtaining Neptunium (VII). Disproportionation of Neptunium (VI) in Alkaline Media"

Leningrad, Radiokhimiya 12, No 3, 1970, pp 471-477

**Abstract:** In dilute alkaline solutions, neptunium (VI) is reversibly oxidized to the heptavalent state by ferricyanide ions. For a constant value of the ionic strength, the equilibrium constant of the reaction is proportional to  $[\text{OH}^-]^3$ . The interaction of neptunium (VI) with silver oxides was studied in alkaline media. It was established that silver suboxide oxidizes neptunium (VI) to an appreciable extent only in solutions with an alkali concentration of more than 8 M. In the presence of  $\text{AgO}$ , neptunium (VII) is formed with 0.2M KOH. Neptunium (VI) is practically quantitatively oxidized by an excess of  $\text{AgO}$  when the alkali concentration is 2-3 M. An excess of  $\text{KBrO}_3$  (at 290-310°) or  $\text{KClO}_3$  (at 390-400°) will completely and rapidly oxidize neptunium to the heptavalent state in alkali metal melts. The interaction of  $\text{NpO}_2$  with the above oxidizing agents is slow and does not go to completion. In some alkaline solutions, neptunium (VI) is to a substantial extent disproportionated into neptunium (VII) and (V). The equilibrium constant of this extremely rapid reaction increases sharply with increasing alkali concentration.

"Nonstationary Flow of a Conductive Viscous Fluid Between Parallel Porous Walls With Heat Transfer"

Moscow, Magnitnaya Gidrodinamika, No 4, 1972, pp 25-30

**Abstract:** The authors consider nonstationary flow of a viscous, incompressible, electrically conductive fluid between two parallel, permeable non-conductive moving walls with regard to heat transfer, when a homogeneous external magnetic field is applied perpendicular to the walls. Both viscous dissipation and Joule heat are considered in the heat transfer equations. In the basic equations of magnetohydrodynamics the rate of permeation is substituted for the transverse flow velocity, and the resultant system of equations is reduced to solution of Volterra integral equations of the second kind. In the case of a magnetic Prandtl number equal to unity a solution in explicit form is found, expressed in tabulatable functions.

"Bending of a Multiconnected Anisotropic Plate Supported Along the Contour"

V sb. Nekotor. zadachi teorii uprugosti o kontsentratsii napryazh i deformatsii uprug. tel. Vyp. 6 (Certain Problems in Elasticity Theory on Stress Concentration and the Deformation of Elastic Bodies. No. 6 -- Collection of Works), Saratov, Saratov University, 1971, pp 59-66 (from RZh-Mekhanika, No 6, Jun 72, Abstract No 6V149)

Translation: The bending of an elliptical anisotropic plate freely supported along the outer contour with a finite number of elliptical openings reinforced by absolutely rigid rings is considered. Complex functionals and Faber polynomials are used in the representation of the solution. After expansion of the right sides into Fourier series, the problem leads to  $(2 + N)$  infinite systems of linear algebraic equations, where  $N$  is the number of internal contours. The system is not investigated. An example is given of a calculation of an orthotropic plate in the form of a circular concentric ring with a moment uniformly distributed along the outer contour. Diagrams of the moments along the contour of a joint with a rigid central disc are given. The sufficiency of the selected number of equations is evaluated in terms of the degree of satisfaction of the boundary conditions. A. G. Ugodchikov.

Translation: A numerical method of solving the problem of bending a thin anisotropic elliptical plate with an elliptical opening, supported on its edge and bent under the action of constant-intensity moments applied along its edge, is presented. By means of functions of generalized complex variables, the solution of the problem reduces to the solution of an infinite system for linear algebraic equations with complex coefficients. The results of numerical calculations on a Ural-2 computer, in which a specialized interpreting system was employed for computations with complex numbers, are discussed. These numerical calculations revealed the substantial effect of the material's anisotropy on the stress-strain state of the plate.

"Concentration of Stresses around Elliptical Elastic Inclusions in a Thin Anisotropic Plate"

Moscow, Mekhanika Tverdogo Tela, No 6, Nov/Dec 70, pp 97-103

**Abstract:** The author considers elastic equilibrium of an elliptical anisotropic plate of constant thickness with a finite number of elliptical openings. Freely fitting elastic bodies made from other anisotropic materials are cemented or soldered in these openings. The plate is assumed to be subjected to bending forces distributed around the outer edge. The solution reduces to an infinite system of linear algebraic equations with complex coefficients. It is shown that a solution may be derived from this system for the case where all or some of the inclusions are absolutely rigid or absolutely flexible. A plate with a single elastic inclusion is considered as a special case. It is assumed that the body is cemented in the center of the plate, and that uniformly distributed bending moments act around the edge of the plate.

"Direct and Inverse Problem of Plane Wave Scattering in Non-Uniform Transition Layers. I. (Problems for Sd-type Waves in the Hyperbolic Case)"

Novosibirsk, Mat. Probl. Geofiz.--Sbornik (Mathematical Problems of Geophysics--Collection of Works), No 3, 1972, pp 8-36 (from Referativnyy Zhurnal--Geologiya, No 5, May 73, Abstract No 5D115 by the authors)

Abstract: The problem of scattering of plane obliquely moving waves of the SH type on a non-uniform elastic and isotropic space (or in the partial case of a transition layer) with arbitrary laws of change of properties as functions of normal coordinates in the hypothesis about the plane character of a reflected wave can be reduced to a certain two-dimensional case with an oblique arbitrary wave which in relation to the nature of an un-uniform medium and angle of incidence can have hyperbolic, elliptical and mixed types. Formulation of the direct problem is given for the first two cases and the direct and inverse problems for the hyperbolic case are solved. Solution of the direct problem is based on the method of separation of variables; the corresponding unidimensional operator turns out to be non-self-adjoint in this instance. The found solution of the direct problem makes it possible to take the inverse problem--determination of the characteristics of non-uniform scattering.

"Holography through a Diaphragm with a Small Opening"

Tbilisi, Bulletin of the Academy of Sciences of the Georgian SSR; March, 1974;  
pp 569-72

**Abstract:** The authors present a theoretical analysis of the object images produced in a pinhole camera and reconstructed from part of hologram whose dimensions are commensurable with the dimensions of the pinhole camera. The identify of these images is shown mathematically, and the possibility of reconstructing the object projective image from a small part of the hologram in white light was found. On this basis the question of object holography in non-coherent light by means of a pinhole camera was studied.

The article includes six equations. There are three references.

"Effect of Radar Resolution on the Spectral Width of a Microwave Signal  
Scattered by the Sea Surface"

Moscow, Radiotekhnika i Elektronika, Vol 17, No 10, 1972, pp 2182-2184

**Abstract:** The theory of radio wave scattering from the sea surface simulated in the form of a superposition of large and small unevennesses has been presented previously as applied to electromagnetic waves [I. M. Fuks, Izv. vuzov MVSSO SSSR (Radiofizika), Vol 9, No 5, 876, 1966]. The nondissipative mechanism of broadening of the spectrum as a result of the orbital motion of the particles is established in the form

$$\Delta f(\text{hertz}) = (q/2)\sqrt{gh\gamma/\pi},$$

where  $h$  is the mean square height of the surface,  $\gamma$  is the dispersion of the slope angles,  $g$  is the gravitational constant and  $q$  is the wave number. Considering that the sea surface is a random surface with respect to heights with a normal distribution law, the question of the effect of the dimensions of the resolved section of the surface on  $\Delta f$  has remained unclear. Expressions are derived for this mechanism, and the band width  $2\Delta f$  at the half power level is  $1/2$

USSR

KRASYUK, N. P., et al., Radiotekhnika i Elektronika, Vol 17, No 10, 1972, pp 2182-2184

defined in the form

$$2\Delta f = \sqrt{2.83 + \delta^2} / \pi.$$

The values of  $2\Delta f$  are plotted as a function of  $L$  -- the linear dimension of the resolved area. In the general case the graphs of the function contain two horizontal segments on the upper and lower levels. The first of these levels corresponds to the limiting high resolution and extends to  $L \sim 30$  meters. In this case the spectral width is in accordance with the function presented by Fuks. The second horizontal segment corresponds to the limiting low resolution of the instrument and extends from  $L \approx 1,000$  meters. In this case the spectral width arises from the dissipative mechanism of damping of the capillary waves and is in accordance with the function presented by F. G. Bass, et al., [Izv. vuzov MVSSO SSSR (Radiofizika), Vol 2, No 2, 290, 1963].

With high resolution of the instrument the value of  $2\Delta f$  is larger, the higher the wind velocity and the slip angle of the radio beam. The minimum slip angle during irradiation of the surface opposite to the wind effect is approximately 3-4° inasmuch as the distribution law of the slope angles differs from the normal in this case and has a shifted mean value.

A70-25129 // New photographic materials for astronomy and spectroscopy (Novye fotografovcheeskie materialy dlia astronomicii i spektroskopii). P. V. Meiktar and O. D. Dokuchayev. Akademicheskaya Nauk SSSR, Vestnik, Vol. 40, Feb. 1970, p. 45-48. In Russian.

Discussion of five astronomic films (A-500, A-600, A-660, A-700, and A-700 F) of improved light-sensitivity, produced at the Kazan Chemical Plant. The resolving power of the films is 70 to 80 lines per mm. The films are covered with a mechanically stable antihalo lacquer film. The A-700 F films retain their high light sensitivity beyond the green region of the spectrum. Several new emulsions are also noted.

"The Reaction of Substituted p-Quinonemonoamines with Di(chloralkyl) Phosphites"

Leningrad, Zhurnal Obshchey Khimii, Vol 42(104), Vyp 11, 1972, pp 2577-2578

**Abstract:** The title reaction occurs by the 1-6 addition and leads to the formation of dichloralkyl [4-arensulfonamidophenyl(naphthyl)] phosphates. The reaction of the unsubstituted dialkylphosphites occurs with more difficulty and at a higher temperature than the analogous reaction with the substituted compounds. IR spectra of the products showed bands at 3160, 1349, 1176, 1248, and 1033  $\text{cm}^{-1}$ , characteristics of the NH,  $\text{SO}_2$ , P — O — Ar,

P — O — Alk groups respectively.

"Method of Recording Threshold Frequency"

USSR Author's Certificate No 285104, Filed 6/03/69, Published 7/04/71,  
(Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 11, 1971, Abstract No 11 A50 P from the Resume).

Trans: In a well-known method the threshold frequency is recorded by conversion of the pulse repetition frequency to a voltage and subsequent comparison of this voltage with a voltage corresponding to the threshold value of frequency. One shortcoming of this method is its inertia, which is particularly manifest with a low threshold frequency. The method suggested allows the time required to record the threshold frequency to be decreased by formation of pulses, the length of which is equal to the period of pulses at the threshold frequency, which merge into a single comparison pulse when the frequency of the initial sequence of pulses becomes greater than the threshold frequency. At the same time, the length of each pulse formed is converted to a voltage. If the frequency of the initial sequence of pulses is less than the threshold frequency, when these pulses arrive at the input of the pulse former, threshold pulses are formed, the length of which is equal to the time interval between two successive pulses of the threshold frequency.

UDC 621.318.563.2

MEKHANIK, V. P., PROKUSHENKOV, G. I., USSR Author's Certificate No 285104,  
Filed 6/03/69, Published 7/04/71.

The pulse convertor transforms the pulse length to a proportional voltage which, however, does not reach the threshold value during the time of a threshold pulse. Increasing the frequency of the initial pulse sequence causes a decrease in the time interval between the threshold pulses formed. When the frequency of the initial pulse sequence reaches the threshold frequency, the threshold pulses merge and a coincidence pulse is formed with a length determined by the time during which the frequency of the initial sequence of pulses is exactly equal to or greater than the threshold frequency. If the control voltage developed by the pulse convertor reaches the threshold voltage, a relay element fires. As soon as the frequency of the initial pulse sequence becomes less than the threshold frequency, formation of coincidence pulses stops. The control voltage becomes equal to zero and the relay element is deactivated. The recording time can be adjusted by changing the threshold voltage at which the relay element fires and also by changing the slope of the control voltage curve. The minimum recording time in the ideal case is equal to the length of a threshold pulse. However, in practice the minimum recording time should be set considering possible fluctuations of the time interval between pulses of the recorded threshold frequency. 2 Figures.

"Estimate of the Accuracy of Panorama Measurers on Superhigh Frequencies"

Moscow, Metrologiya, No 3, 1972, pp 31--35

Abstract: Panorama measurements in circuits with distributed parameters, like the majority of other measurements on superhigh frequencies, are erroneous, the components of the error are usually a random error and a mismatching error. If the values of the modules of the dispersion coefficients on every frequency are not known, additional conditions describing the statistical characteristics of the modules of dispersion coefficients in the frequency band must be introduced for estimating the resulting error. On the basis of these conditions, a method for the calculation of the resulting error in the frequency band is suggested. The confidence interval of the error by a 0.997 fiducial probability can be found from a plotted graph without calculations. The application of the method is demonstrated on an example. Two illustr., seven formulas, three biblio. refs.

"Investigation of the Mechanical Properties of Type NIAN Alloys in the Cast and Deformed State"

V sb. Protsessy formoizmeneniya met. i splavov (Processes of Deformation of Metals and Alloys--collection of works), Moscow, "Nauka", 1971, pp 122-125 (from RZh-Mekhanika, No 10, Oct 71, Abstract No 10V893)

Translation: The mechanical properties (breaking point, relative lateral contraction, relative longitudinal extension) of type NIAN alloys (Ni, Nb, Al) were determined in the temperature range of 20-1100°C by a standard procedure. The resultant data show that the strength decreases monotonically with an increase in testing temperature. The ductility properties of the alloys change little with an increase in temperature up to a certain point, after which they increase noticeably. Adding molybdenum and zirconium to NIAN-2 alloy increases the strength properties of the alloy appreciably throughout the entire temperature range. It was found that deformation increases the strength and ductility of NIAN type alloys. The

"Nauka", 1971, pp 122-125

breaking point of NIAM-2 alloy at room temperature in the deformed state is 2.5 times the breaking point of the alloy in the cast state. The increase in strength of type NIAM alloys after deformation may be attributed to cold hardening and deformation aging. Authors' abstract.

MEKHED, G. N., MINTS, R. S., AKIF'YEVA, O. I., TOROPOV, V. M.**"Flow Curves for Nickel-Base Alloys"**

V sb. Protsessy formoizmeneniya met. i splavov (Processes of Deformation of Metals and Alloys--collection of works), Moscow, "Nauka", 1971, pp 140-144 (from RZh-Mekhanika, No 10, Oct 71, Abstract No 10V884)

Translation: A study was made of the effect which molybdenum and zirconium have on the mechanical properties of Ni-Nb-Al alloys in the cast state at heat-treat temperatures. The mechanical properties were determined by studying specimens on the MK-20 machine at temperatures of 900, 1 000, and 1 100°C. From the working diagrams, the maximum tangential stresses  $\tau_{max}$  and octahedral shear  $q_n$  were computed, and flow curves were plotted. The results show that doping nickel-base alloys with Mo and Zr has a favorable effect on the high-temperature strength of these alloys, which may be attributed to the solubility of these elements in each of the structural components of the alloys, and to the refining action of Mo and Zr on the grains of the metal and on the boundaries between them. Authors' abstract.

"Mechanical Properties of High-Strength Steels Grades 45KhNT and 60KhNYu"

V sb. Protsessy formozmeneniya met. i splavov (Processes of Deformation of Metals and Alloys--collection of works), Moscow, "Nauka", 1971, pp 109-118 (from RZh-Mekhanika, No 10, Oct 71, Abstract No 10V789)

Translation: The paper gives the mechanical properties and chemical composition of 45KhNT and 60KhNYu high-strength steels from room temperature to 1200°C. The mechanical properties were determined in tensile and impact strength tests. At room temperature, the breaking point of 45KhNT steel reaches 90-91 kg/mm<sup>2</sup>, the yield point is 70-74 kg/mm<sup>2</sup>, relative lateral contraction is 44%, and relative longitudinal extension is 17%. Under the same conditions, 60KhNYu steel has  $\sigma_b \approx 98$  kg/mm<sup>2</sup>,  $\sigma_s \approx 76$  kg/mm<sup>2</sup>, relative lateral contraction is 48%, and relative longitudinal extension and impact strength are the same as for 45KhNT steel. The presence of unstable regions of supercooled austenite on isothermal conversion diagrams means that these steels can be thermoplastically heat treated at low temperatures. Authors' abstract.

"Comparative Evaluation of Fatigue Strength Under Random and Programmed Loads"

Tr. Kuybyshev. aviat. in-t (Works of Kuybyshev Aviation Institute), 1971,  
No. 48, pp 231-245 (from RZh-Mekhanika, No 3, Mar 72, Abstract No 3V1506)

Translation: Various methods for constructing a repetition curve necessary for the formation of block programs for fatigue tests are discussed. Program tests of samples with a hole, made of 30KhGSA steel and D16AT alloy are given for which three types of blocks constructed on the basis of maximum peak values of the particular achievement, in terms of the extrema (after substituting the sign of the load) and on the basis of scale were applied. The results of program tests are compared with the results of tests under a random load on the basis of an achievement covered earlier. It is shown that block loading is a more harmful (in terms of breakdown) form of testing than a random test, so that the first two types of blocks give results that are little different. The program constructed on the basis of dimensions is called unsuitable for the reproduction of operational loading. 10 ref. S. V. Metinov.

"Effects of Noise and Vibration on Sailors Under Conditions Prevailing on Ships"

Moscow, Gigiyena i Sanitariya, No 9, 1971, pp 25-27

Abstract: Among the many factors which make life on ships different from life on land, noise and vibration seem to be especially important, because the crew is exposed to these factors both at work and during rest and because in the machine section the intensity level in the low and medium frequency ranges exceeds the limit permitted on industrial plants by 10-25 decibels. Blood serum tests performed on 86 sailors on eight ships revealed a statistically significant increase, among machine shop personnel, in glucose concentration on the 15th day and in beta lipoproteins on the 30th day of cruising. In a similar group of machine-servicing sailors who were given daily doses of 5 mg of thiamine and 50 mg of nicotinic acid admixed in their food, plasma glucose and beta lipoprotein concentrations were essentially the same as among deck crew members who served as controls. Although the

**"Investigation of the Kinetics of Ammonolysis of m-Xylene by a Gradientless Method"**

Baku, Azerbaydzhanskiy Khimicheskiy Zhurnal, No 3 (69), 1970, pp 29-32

**Abstract:** In this paper the authors study the kinetics of ammox-oxidation of m-xylene over a vanadium oxide catalyst (6% V<sub>2</sub>O<sub>5</sub> and 2% MnO<sub>2</sub>) applied to calcined aluminum oxide in a system with continuous circulation. To determine the fraction of homogeneous reaction, noncatalytic experiments were conducted under conditions similar to the catalytic experiments. More than 90% of the m-xylene was unreacted. Use of the gradientless method made it possible to find the reaction rates in differential form. After the onset of the steady state, the reaction rate was determined from the formula  $\dot{n} = n/G\Delta t$ , where n is the number of moles of reacted or formed products in time  $\Delta t$ , G is the amount of catalyst in grams, and  $\Delta t$  is the time from the instant of the onset of the steady state in hours. The effect which the concentrations of O<sub>2</sub> and NH<sub>3</sub> have on the bulk conversion of m-xylene, and on the rate of formation of main products and byproducts of the reaction was studied. It was found that 1/2

"Densitometric Determination of Opium Alkaloids with Use of Thin-Layer Chroma-  
tographic Separation"

Moscow, Farmatsiya, Vol XI, No 6, Nov-Dec 71, pp 37-42

**Abstract:** Spectrophotometric determination of the principal opium alkaloids following separation in a thin layer of sorbent (and also on paper, in combination with use of densitometry), has been practiced for roughly a decade. However, quantitative densitometric determination following separation in a thin layer of sorbent has not been developed.

Using the Soviet-developed DI-3 densitometer, the authors made quantitative determinations of five alkaloids for tincture of opium (3.1% alkaloids) and opium powder (29.27%), arriving at the following figures: morphine, 0.98% and 11.46%; codein, 0.35% and 4.36%; thebaine, 0.14% and 1.69%; papavarine, 0.28% and 3.26%; and narcotine, 1.32% and 8.5%. These figures are in close agreement with those obtained with use of the method prescribed by the USSR State Pharmacopoeia, 10th ed.

1/2

21

USSR

CHICHIRO, V. YE., et al., Farmatsiya, Vol XX, No 6, Nov-Dec 71, pp 37-42

It was demonstrated that thin-layer chromatography and paper chromatography are of equal sensitivity, but that the interval of direct proportionality between concentration and the optical density of the alkaloids is much greater with use of the thin-layer technique ( $5\text{-}60 \mu\text{g}$ , as against  $5\text{-}25 \mu\text{g}$ ). A distinct advantage of thin-layer chromatography in the analysis of opium alkaloids is that it requires only a third of the time needed for paper chromatography. Full details of the laboratory methods used, along with graphic and tabular data from the results, are included in the paper.

"Organizing Storage and Retrieval of Data on Chemical Compounds"

V sb. Tsifr. vychisl. tekhnika i programmir. (Digital Computer Technology and Programming - collection of works), vyp. 7, Moscow, "Sov. radio", 1972, pp 111-117 (from RZh-Kibernetika, No 8, Aug 72, Abstract No 8V627)

Translation: This article deals with a method of algorithmic coding of chemical compounds developed at IIIITEKhIM [expansion not known] (Moscow), and also with an algorithm for retrieving information on these compounds. Magnetic tape storage of the codes of the chemical compounds in the computer memory is done by the direct method. Criteria of sense correspondence are described as well as an algorithm for search of chemical compounds. The main distinguishing feature of the given data retrieval system of factographic type is the combination of the descriptor method of characterizing documents with a specialized symbolic language of linear codes. Authors' abstract.

An element which lies below a thick layer of homogeneous ground of unit width is discussed as a single-span beam with swing supports (FIG. 1). The moment-curvature diagram for this beam is taken in the form of the Prandtl diagram (FIG. 2). It is assumed that the element does not have an underlying stratum, and that its height is small. The pressure  $P$  which

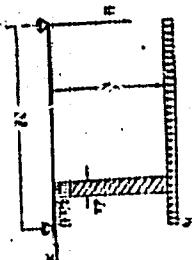

FIG. 1

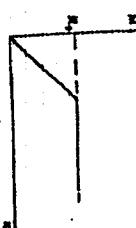

FIG. 2

does not vary over time is applied instantaneously to the surface of the soil. We assume that the instant  $t = 0$  corresponds to the instant when the shock wave reaches the element under consideration which is bent.

We will represent the soil layer above the beam in the form of a system of elementary poles with width  $dx$  and height  $H$ , and we will ignore tangential stresses which arise between these poles due to the curvilinearity of the reflected shock wave. This problem has been studied in the formulation for the case of an elastic core in article [1], and the following

"A Problem in the Nonstationary Motion of a Viscous Liquid"

Baku, Izvestiya Akademii Nauk Azerbaydzhanskoy SSSR, Seriya Fiziko-  
tekhnicheskikh i Matematicheskikh Nauk, No 3, 1972, pp 93-98

**Abstract:** In connection with the problem of the motion of a viscous liquid through a tube with permeable walls, the authors theoretically consider a nonstationary, rectilinear, parallel motion of two viscous fluids between two coaxial cylindrical tubes, under the assumption that the tube of lesser radius is concentrically immersed, with a specified velocity, in the cylindrical tube of larger radius. They begin their solution by finding the change in pressure on the end face of the immersed cylinder, in the presence of the layer adjacent to the wall of the larger cylinder, for a known immersion velocity. The solution is then found by solving a system of two partial differential equations, both of which are given.

"Radioprotective Effect of Selenium"

Baku, Doklady Akademii Nauk Azerbaydzhanskoy SSR, No 3, 1973, pp 12-17

**Abstract:** Sodium selenite administered to Wistar rats 20 minutes after X-irradiation at 490 rad had little protective effect, the survival rate and average life-span being insignificantly higher than in the controls (50% survival rate by day 30). However, the same dose of the compound administered 30 minutes prior to irradiation (intraperitoneally, subcutaneously, or perorally) had a markedly protective effect; the survival rate was 90% and the average life-span  $28 \pm 3.6$  days. When sodium selenite was combined with vitamins E (as an antioxidant) and A (to promote the retention of vitamin E in the body), the protective effect was even more pronounced, the survival rate and average life-span being significantly higher than in the controls (given selenium but not the vitamins).

"Selenium and Tumor Growth Under Experimental Conditions"

Baku, Doklady Akademii Nauk Azerbaydzhanskoy SSR, No 3, 1973, pp 18-24

**Abstract:** In mice and rats with transplanted tumors (M-1 sarcoma, Ehrlich's ascitic tumor, and Geren's carcinoma), a single injection of sodium selenite significantly retarded the growth of the tumor, especially if the injection was given when the tumor could barely be felt. The inhibition of tumor growth was even more pronounced when sodium selenite was combined with X-irradiation. In addition, the compound increased the animals' tolerance for radiation. When the animals received the tumor suspension after it had been treated with sodium selenite and heated to 40° for 2 hours, tumors did not begin to appear until 12 to 21 days after inoculation compared to 9 days in the control (given the tumor suspension treated with sodium selenite at room temperature). The inhibitory effect of the selenium compound is attributed to its ability to stimulate the production of endogenous antioxidants and lower the oxygen concentration of the tissues.

"Spectra of Organic Molecules Introduced Into a Metallic Matrix, and the Exciton Mechanism of High-Temperature Superconductivity"

Leningrad, Fizika Tverdogo Tela, Vol 13, No 9, Sep 71, IP 2732-2742

**Abstract:** The authors consider renormalization of the spectrum and quenching of excitons resulting from the effect of interaction between excitons and metal conduction electrons. They also discuss the spectrum of an organic impurity molecule introduced into a metallic matrix. It is shown that in the absorption spectrum of these systems absorption lines corresponding to the simultaneous excitation of the organic molecules and the metallic matrix can be observed in addition to the absorption lines corresponding to excitation of the organic molecule alone. Electron-electron interaction at high exciton concentrations is investigated. The case of laminar organometallic media is also discussed. It is shown that under certain conditions effective interelectron interaction at high exciton

Sep 71, pp 2732-2742

concentrations may lead to pairing of electrons and, accordingly to the development of superconductivity. However, the effect may be inhibited by exciton decay accompanied by the decay of Cooper pairs. This process may be insignificant if the lifetime of an exciton is determined by radiation decay rather than by the nonradiative transition accompanied by the excitation of electron-hole pairs. The authors thank V. L. Ginzburg and the members of his seminar for constructive criticism. One figure, bibliography of thirteen titles.

"Plant Growth Regulator"

USSR Author's Certificate No 334961, Filed 30/07/69, Published 24/05/72  
(Translated from Referativnyy Zhurnal Khimiya, No 24(II), 1972, Abstract  
No 24N643 P, by T. A. Belyayeva)

Translation: It is suggested that the Na-salt of octyltoluic acid (I) be used as a plant growth regulator. I is produced by alkylation of xylenes with diisobutylene with subsequent oxidation of tert-octylxylene with  $O_2$  and neutralization of the acid with an aqueous solution of NaOH or soda. The influence of I on the coleoptiles of wheat sprouts and the growth of winter wheat roots is demonstrated.

that admixtures which are active in the crystalline state become inactive in the amorphous state. Under deoxygenization of polycrystalline hexagonal selenium the conductance at a given temperature reduces by a factor of 1000; i.e., is approximately 100 times greater than in the case of single crystalline selenium. This is attributed to two factors: (a) in the production of single crystals of selenium the selenium is cleaned of oxygen admixtures; and (b) oxygen atoms in polycrystalline samples, by reducing the intermolecular potential barriers, cause a growth in the mobility of current carriers during the motion of current carriers. The change in the electrical properties of single crystals of selenium under deoxygenization is attributed to the entry of oxygen atoms in the selenium lattice.

"Analysis of the Influence of Nonlinearities Upon the Readings of Electronic Compensators"

**Yerevan, Izvestiya Akademii Nauk Armyanskoy SSR, Seriya Tekhnicheskikh Nauk, No 1, 1972, pp 35-40**

**Abstract:** The article presents an analysis of the influence of nonlinearities such as "the insensitivity zone" and "limitation" of the indicator speed of an autocompensator upon its readings, the influence of the linear part of the instrument not being taken into account. Expressions are obtained for determining the relative time of influence of the insensitivity zone upon the character of movement of the autocompensator indicator in relation to the amplitude and frequency of the sinusoidal input signal. Expressions are also obtained for determining the amplitude of the first harmonic of the movement curve of the instrument indicator in relation to the value of the insensitivity zone at various amplitudes of the input sinusoidal signal. Graphs of the indicated relationships are presented. 4 figures. 3 references.

"Function of the Genome of Inactivated Sendai Virus in the Formation of Artificial Heterokaryons"

Leningrad, Voprosy Onkologii, No 1, 1970, pp 58-62

**Abstract:** Using the immunofluorescence method, the authors found that during the formation of heterokaryons obtained from HRO cells and chick fibroblasts, Sendai virus inactivated by ultraviolet irradiation or treatment with betapropiolactone stimulated the production of T-antigen alone. There was no biosynthesis of viral components (V-antigen, hemagglutinins, ribonucleoproteins) or of the complete infective virus. T-antigen was found in ordinary cells and heterokaryons for a brief period of time, disappearing after 5-7 days. T-antigen occurred only in the cytoplasm, not on the cell surface.

"interrupted Transfer of T4B Phage Chromosomes into Cells, Cyclic Permutation of Genes, and Infective Activity of Fragmented Genomes"

Moscow, Molekulyarnaya Biologiya, Vol 5, No 3, May/Jun 71, pp 444-452

Abstract: At low incubation temperatures (0-20°C), the rate at which molecules of phage DNA are transferred into cells considerably decreases. With a brief treatment in a mixer (14,000 RPM, 40 sec), it is possible to interrupt the DNA transfer at a stage when only a portion of the phage genome has entered the cell. Several DNA fragments introduced into the cell by various phages are jointly able to develop infection and to form mature particles. This proves that: 1) different T4r+ phages simultaneously introduce, into the cell, separate DNA fragments with various sets of genes and therefore cyclic gene permutations must take place in the chromosomes of these phages; and 2) artificially fragmented genomes possess the ability to induce infections.

"Branching of Solutions to Nonlinear Equations with Several Complex Parameters"  
"Branching of Solutions to Nonlinear Equations with Several Complex Parameters"  
Moscow, Sibirskiy Matematicheskiy Zhurnal, Vol 12, No 4, Jul/Aug 71,  
pp 805-811

Abstract: The author studies the problem of branching of solutions to a certain class of equations with analytical nonlinearities. The concept of a simple solution introduced by A. Ye. Gel'man for an equation of one complex parameter is expanded to an equation of several complex parameters. He examines the question of the convergence of formal solutions. He cites the conditions for the coefficients of a formal equation for which the solution will be real and simple. He proves the convergence of all formal solutions of the equation examined and shows that the number of non-identical formal solutions is finite. Using the mathematical apparatus of theorems, the author formulates his problems and finds a proof thereof which he expresses through equations. The article contains 10 bibliographic entries.

CONTROL RODS FOR FAST REACTORS WITH SODIUM COOLANTS

Article by E. A. Ponomarev, <sup>Translated by R. K. Scoville</sup> and V. I. Yan. Proceedings of the International Conference on Reactor Materials and Structural Behavior of Fast Reactors, Russia, International Working Group for Fast Reactors Specialists Meeting, Dneprograd, 4-8 June 1971

I. Introduction

In the practice of reactor construction, various methods for regulating the nuclear reaction occurring are known. The most widely distributed method for fast reactors with a sodium coolant is absorption of the neutrons by regulating rods. At the present time, this method is being used in reactors that have been built or are under construction: the BOR-60, BN-300 and BN-600 [1].

The basic functions of the regulating rod (control rods) of fast reactors are:

- compensation of temperature and power effects;
- compensation of burn-up;
- regulation of power;
- emergency stopping.

In distinction from water-cooled, water-moderated reactors, control rods of fast reactors have a number of principal features, associated with the specifics of the operating conditions in the reactor. All the control rods developed at the present time are intended for operation in a medium of liquid sodium in a temperature range of 400--700°C at maximum fast neutron fluxes of up to  $1 \times 10^{14} \text{ n/cm}^2 \text{ per second}$ . The hard spectrum, high neutron fluxes and high temperatures, and the aggressive medium impose a number of specific requirements upon the materials of the control rods with respect to efficiency, permissible energy liberation, and burn-up, physico-chemical properties, and radiation stability.

MELAMEDOV, I. M.

Fizicheskiye Osnovy Nadezhnosti (Physical Principles of Reliability),  
Leningrad, Energiya Publishing House, 1970, 152 pp

Annotation: Modern physical concepts of the mechanism and kinetics of a number of physicochemical processes occurring in the materials of the components of technical devices as a result of various factors are presented in the book. The effect of these processes on changes in the properties and parameters of component materials and on their life and reliability are considered. Some of the characteristics of the life of materials and the speed of processes given in the book can serve directly as reliability indicators or join generally accepted reliability indicators.

The book can be useful to engineers working in the field of investigation and provision of the reliability of technical devices, and to students and teachers of higher technical institutions specializing in the field of the theory and techniques of reliability.
