ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. INCREASING THE TEMPERATURE FROM 1 TO 35DEGREESC CAUSED NO SIGNIFICANT INTENSIFICATION OF THE PROCESS OF ABSORPTION OF PRIME90 SR BY POTATO TUBERS. DATA ON TEMPERATURE COEFFICIENTS OF THE REACTION OF STRONTIUM ABSORPTION BY THE TUBERS DEMONSTRATED THE NONMETABOLIC NATURE OF THE PROCESS. THE DIFFUSION NATURE OF THE PROCESS WAS INDICATED BY THE DIFFUSION COEFFICIENTS CALCULATED FOR STRONTIUM AND CALCIUM IN THE TUBER. COMPARISON OF THE DATA OBTAINED UNDER VARIOUS EXPERIMENTAL CONDITIONS WITH RESPECT TO TEMPERATURE COEFFICIENTS MADE IT POSSIBLE TO CONCLUDE THAT THE ABSORPTION OF CALCIUM AND STRONTIUM BY POTATO TUBERS IS A PHYSICAL PROCESS, DIFFUSION, AND IS NOT METABOLIC IN NATURE. Trade

INTERNATIONAL FREIGHT SHIPMENTS BY AIR

Article by N. Mel'nikova, Chief Engineer of the International Air Transport Association of the USSR Ministry of Foreign Trade in the International Air Transport Association, Transportnoye Stroitel'stvo, Moscow, No 10, 1971, p. 901.

Each year sees an improvement in the economic collaboration of the CMEA member nations. It is based on full equality, respect of independence and sovereignty, mutual help and fraternal mutual aid. Frequent specialization and cooperation is developing and mutual trade is expanding. The successful collaboration of the socialist countries is greatly dependent on the organization of shipments.

The effectiveness of foreign trade greatly depends on the means with which shipments are equipped, on the rational distribution of freight, on the amount of transport equipment, on the speed of transport, on the cost of transport and on the quality of transport. Transport development is of great significance for the CMEA member nations whose industrial enterprises, in particular, turning export products, are often at considerable distances from the markets.

The main mass of freight, within the individual socialist countries and between them, is carried by railroad transport. The CMEA member nations have begun to make use of automobile transport in the past few years. Collaboration by the CMEA member nations in the field of air transport, ports, and the participation of the Soviet Union in its construction to aircraft, technical and operating requirements for specialized trucks, trailers, semi-trailers, and motor trains for international shipments were developed and approved within the CMEA framework. Technical conditions were developed and design and maintain international motor roads as well as recommendations for their maintenance. Suggestions were developed to organize repair and technical maintenance and to provide technical and other assistance to the automobile transport facilities of the CMEA member nations along the main highways used for international shipments.

The Soviet Union already has certain know-how in the organization of international freight shipments by automobile transport. Even in the pre-war period Soviet vehicles were carrying freight between the USSR and the Mongolian Peoples Republic and, later, between the USSR and China. The

. 13 .

VKS: 57665
13 DEC 1971

transportation of foreign trade freight by automobile transport between the USSR, including Moldavia, and the European socialist countries. It includes:

The Belorussian SSR takes an active part in the USSR's economic collaboration with socialist countries. This is facilitated by the great success in the development of the MOWA, national economy. The territorial proximity of the European socialist countries, and the development of the transport network with direct access to common borders.

The Belorussian SSR's export freight suppliers began to use automotive transport primarily to ship food commodities meat and animal fat, edible fat, confectionery, cement, and other items between automotive transport has a high delivery rate. As compared to railroads, the freight delivery period by automotive transport is reduced 3-6 times in international traffic. For example, the time taken to transport freight from Minsk to Poland, the USSR, Czechoslovakia, Hungary, Romania, and Bulgaria whereas it takes 10-15 days to deliver it by railroad.

At the same time, the high freight forwarding facilities make available small cargo lots to automotive transport such as spare parts for machines and equipment, electrochemical items, and radiochemical items.

The "door-to-door" ability of automotive transport, that is directly from the supplier, enterprise to that of the receiver into the strict a large number of loading/unloading operations and to ensure a better preservation of freight in transit and also the possibility to reduce packaging costs by the use of lighter containers or even by not using containers at all. For example, the truck tractor vehicles plant had a savings of nearly 100,000 rubles in 1970 through the use of lighter containers in which to pack spare parts carried by automotive transport and through reduction in labor costs for container manufacture.

In the Soviet Union, the organization and implementation of commercial carriers of international freight shipments has been tried on the USSR Ministry of Motor Transport and Highway which can operate the automotive facilities from the common carrier motor vehicle management of other union republics to carry out these shipments. In particular, the transport facilities of the motor vehicle enterprises subordinated to the Belorussian SSR Ministry of Motor Vehicle Transport are recruited to transport foreign trade freight to the socialist countries of Europe. It should be pointed out that the USSR Ministry of Motor Vehicle Transport gives close attention to the organization of such shipments. The USSR foreign trade organizations are pleased with the state of shipments, especially in the matter of freight preservation during transit, and manifest interest in the further development of this type of shipment. However, the main mass of export freight from the USSR to the European socialist countries is still carried by railroad transport.

It appears expedient for the CMA member nations to make maximum use of automotive transport in the shipment of export-import freight. Shifting

part of the foreign trade freight from railroad to automotive transport will help reduce the overload on the more important international railroads lines.

In our estimation, we should organize the specialization of motor vehicle enterprises to implement international automotive shipment subordinated to the Belorussian SSR Ministry of Motor Vehicle Transport to ensure the shipment of spare parts from different areas of Belorussia and areas of the Soviet Union contiguous to it.

"Voltage And Current Regulator"

USSR Author's Certificate No 265968, filed 6 June 68, published 1 July 70 (from RZh--Elektronika i yeye primeneniye, No 1, January 1971, Abstract No 1B469P)

Translation: A circuit is proposed for a voltage and current regulator in which the transition from a regime of current regulation to a regime of voltage regulation is accomplished automatically. In order to assure small inertia during transition from regime to regime, in the regulator a supplementary comparator circuit is used which measures the load current, the signal from which is fed across a semiconductor diode to the input of the comparator circuit of the voltage regulator, where a signal is fed (also across a semiconductor diode) proportional to the output voltage of the regulator. If the signal proportional to the output voltage is larger than the signal from the output of the comparator circuit of the current regulator, then the semiconductor diode of the current regulator cuts off, and the comparator circuit of the voltage regulator controls the common regulating element of the regulator which assures voltage regulation.

"Study of the Mass Spectrum of a AK-System in π^+p -Interactions at 4 and 5.1 Gev/c"

Moscow, Pis'ma v Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol. 11, No. 1,
 5 Jan 70, pp 31-35

Abstract: The results of a study of the spectrum of the effective masses of a
 AK-system are reported. The spectrum was obtained in investigating π^+p -interactions
 in a 24-liter and a 1-meter propane bubble chamber irradiated in π -meson beams of
 the proton synchrotron of the Joint Institute of Nuclear Research with pulses of
 4 and 5.1 Gev/c, respectively. An investigation of the structure of the effective
 mass spectrum of a AK-system was of interest from the viewpoint of observing new

resonances with zero strangeness and the decays of different isobars via the channel $N^* \rightarrow \Lambda + K$, to determine the relative probabilities of these decays. Approximately 230,000 photographs were analyzed for each bubble chamber. The effective mass spectra of ΛK^0 combinations for events in which the decay of a Λ -hyperon and a K^0 -meson were simultaneously recorded in the chamber are graphed. The graphs show a considerable excess in the number of events above the background in the mass region 1.61-1.96 Gev/c². It is shown that this anomaly is not associated with the reflection of known resonances Y^* (1385) and K^* (890) in the ΛK^0 -spectrum. The total excess in the number of events over the background in the mass interval 1.61-1.96 Gev/c² was 114 ± 13 . The experimental data verify the existence of two resonances with masses about 1685 and 1935 Mev/c² and widths of the order of 150 Mev/c². It is concluded that the anomaly observed in the effective mass spectrum of ΛK can be explained only by the decay of the isobar S_{11} (1710), P_{11} (1750) via the channel $N^* \rightarrow \Lambda + K$ or by the existence of a new resonance with mass about 1685 Mev/c², as the data of R. Erbe et al indicate.

"Chemistry of Indole. XXXIII. Pyridylethylation of the NH Group of Indole Compounds"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 2, Feb 73, pp 207-212

Abstract: Direct pyridylethylation of pyrrole, of a series of indole compounds, of carbazole and carboline was carried out taking advantage of the ability of highly polar aprotic solvents -- such as dimethylsulfoxide [DMSO] -- to activate the anion forming on the NH group to such an extent that even the relatively poorly polarized bond in 3-vinylpyridine was adequately activated for the reaction to take place. The activation by DMSO is based on the fact that in absence of protic solvents, when no hydrogen bonds can form, the anions being formed are solvated to a lesser degree and therefore are more reactive. The reaction goes especially well when excess 2-methyl-5-vinylpyridine is used, and the reaction mixture is heated to 100-200°. Metallic sodium or sodium ethoxide can be used as the alkaline reagents.

Riga. Khimiya Geterotsiklicheskikh Soyedineniy, No 9, Sep 73, pp 1273-1278

Abstract: Reaction of 2-aminoindole with α , β -unsaturated aldehydes and ketones yields α -carboline. In this reaction the β -carbon atom of the keto compound attacks the C₃ atom of the indole. The reaction with bifunctional derivatives occurs in many cases with a split of the carbon-carbon bond, leading to the formation of a pentacyclic system of indolo[2,3-b]- α -carboline. Identical compounds can be obtained from 3-arylidene-2-aminoindole or 3-arylideneoxindoles. Substituting one molecule of 2-aminoindole by other acceptors failed to yield nonsymmetric structures.

"A Study of the Content of Macromolecular Compounds in Continuously Cultured Typhoid Bacteria. Report IV. Effect of Bacterial Concentration on the DNA/Mass Ratio in the Presence of Balanced and Unbalanced Growth"

Moscow, Zhurnal Mikrobiologii, Epidemiologii, i Immunobiologii, No 3, 1973, pp 66-71

Abstract: The DNA/mass ratio of *S. typhi* vaccine strain Ty₂ 4446 cultured under various conditions was studied to determine if this ratio could serve as an index of optimum culturing conditions. Cultures grown in excess glucose (1.0-11.5 mg/ml) and limited glucose (0.04-0.32 mg/ml) were compared. Bacterial concentrations were varied in excess glucose by changing the medium's O₂ content and in limited glucose by changing the initial glucose concentration prior to dilution. Experiments showed that the DNA/mass ratio did not depend on bacterial concentration in limited glucose but was high at 0.2-1 billion cells/ml and low at smaller and greater concentrations in excess glucose. The higher DNA/mass ratio noted in exponential growth (balanced) in previous papers can be explained by these findings: Exponential growth occurs in excess

USSR

ESNAK'YAN, I. A. and MEL'NIKOVA, V. A., Zhurnal Mikrobiologii, Epidemiologii, i Immunobiologii, No 3, 1973, pp 66-71

glucose, and since under such conditions DNA/mass ratio varies with bacterial concentration, when the latter reaches 0.2 billion cells/ml the DNA/mass ratio begins to climb until glucose becomes limiting. This suggestion was confirmed experimentally. The range of bacterial concentrations at which the DNA/mass ratio is high in excess glucose also corresponds to high physiological activity and high concentrations of other macromolecular compounds, as shown in previous studies. Thus the DNA/mass ratio can be used as a sensitive index of optimum conditions in the culture medium.

"Study of the Content of Macromolecular Compounds and the Continuous Cultivation of Typhoid Bacteria. Report III. Comparative Study of Physiological Activity and Content in the Cells of Nucleic Acid and Protein Under Conditions of Excess Glucose and Its Full Utilization"

Zh. mikrobiol. epidemiol. i immunobiol. (Journal of Microbiological Epidemiology and Immunobiology), No 2, 1973, pp 11-16 (English Resume) (From RZh-Biologicheskaya khimiya, No 12, Jun 73, Abstract No F1623)

Translation: It was found that in the continuous cultivation when glucose is fully utilized, the activity of cells and their DNA and RNA content depend solely on the rate of growth which is equal to the rate of dilution which can be altered to produce a population with certain given properties. When there is an excess of the substrate, the rate of consumption of glucose and the content of DNA and RNA and protein in the cells depends not only on the growth rate but also on the concentration of microorganisms. Optimal concentrations of microorganisms in which the highest content of macromolecular compounds and the highest physiological activity of cells are within the range of 0.2-1.2 billion/ml.

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 11, 1971, pp 44-49

Abstract: The DNA-mass ratio was determined in typhoid bacilli grown under various conditions. The microbial population begins to divide only after the DNA/mass ratio exceeds the critical value of 1.68. This ratio assumes a minimum value during the interphase, increases prior to the beginning of the first division, and remains at a relatively steady level of about 3.5 throughout the exponential reproduction phase and the reduced reproduction phase. The DNA/mass ratio assumes these values during both continuous and periodic culturing, at higher and lower cell division rates, under various nutritional conditions, and in different types of synthetic media.

"Amplification on the Three-Frequency Interaction Principle"

Gor'kiy, Izvestiya VUZ-Radiofizika, No 10, 1972, pp 1517-1526

Abstract: A weakly linear system with three degrees of freedom, excited at one of its characteristic frequencies, is considered in this paper. With an outside oscillation, at a harmonic of a frequency close to that characteristic frequency applied with sufficiently low amplitude, it is shown that an amplification effect with frequency conversion can be obtained in such a system. The behavior of the amplitude-frequency characteristics and the stability of the system are investigated as functions of its parameters. It is noted that this effect may be used as the basis for a compact parametric amplifier in which a self-oscillating system excited by the negative resistance of a tunnel diode, for example, is used for pumping. The authors express their gratitude to M. I. Rabinovich for posing the problem and for participating in the discussion of the results.

"A Study of the Content of Macromolecular Compounds in Continuous Cultures of Typhoid Bacilli. Report I. The Relationship Between the Rate of Cell Division and the Intracellular Content of DNA, RNA, and Proteins"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 5, May 71,
pp 62-66

Abstract: The *S. typhi* Ty₂ 4446 vaccine strain was used in this investigation of the cell division rate and the intracellular concentration of various compounds during continuous and periodic culturing. The fastest rate of cell division occurred in the exponential phase of proliferation, but was constant for any given medium. With increasing concentration of nutrients in the medium, the rate of division and the concentration of intracellular contents also increased. For example, at a cell division rate of 0.170 generations per hour, the concentrations of intracellular compounds, expressed in micrograms per 10³ cells, were: RNA -- 1.176; proteins -- 10.71; acid-soluble compounds -- 0.0522; optical density -- 0.0402; and DNA -- 0.191. At a cell division rate of 0.710 generations per hour, the corresponding figures were: 3.300; 21.07; 0.352;

1/2

USSR

MEL'NIKOVA, V. A., et al, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 5, May 71, pp 62-66

0.147; and 0.732 (last figure at division rate of 0.68). Although some authors report a decrease in the concentration of DNA in analogous investigations, the discrepancy is only apparent and due to different methods of calculating the results. In this study, all concentrations are expressed per unit number of cells, while the other authors use a unit volume of the biomass as the common denominator. All findings indicate that the size and weight of individual cells increase with an increasing rate of cell division.

"Combined Topical Application of Antibiotics and Corticosteroids in the Treatment of Burn Wounds"

Moscow, Sovetskaya Meditsina, Vol 33, No 7, Jul 70, pp 108-112

Abstract: Hydrocorticocin ointment (active ingredients, hydrocortisone and neomycin) was used for topical treatment of burn wounds in 76 patients and on excessively scarred skin donor areas in 27 patients. The burns were of the 2nd and 3rd (both A and B) degree and covered from 5-45 percent of the body surface area. The results indicated that hydrocorticocin is effective in such cases, particularly for treatment of 3-A burns, if it is applied after detachment of the scab. Hydrocorticocin prevents excessive proliferation of the granulation tissue, promotes epithelization, reduces inflammation, and eliminates microflora, thus accelerating healing. Formation of keloid scars is markedly inhibited. Since the drug is applied topically, it does not upset the body's natural balance of corticosteroid hormones.

**ANTIBIOTICS IN THE PROPHYLAXIS AND TREATMENT OF BACTERIAL
INFECTION IN TRAUMATOLOGIC AND ORTHOPAEDIC PATIENTS**

V. N. Mel'nikova, A. I. Gladshteyn, O. V. Markova, M. I. Maloz,
N. P. Ivanova, Z. G. Sirinova and V. V. Kuzmenko

Facts on the prophylaxis and treatment with antibiotics of infected wound, in traumatologic and orthopaedic patients based on clinical and laboratory data of USSR are presented in the paper. In primary surgical wound debridement the authors prescribe penicillin with streptomycin or tetracyclin. It is stressed that the use of antibiotics in the so-called "clean" orthopaedic operations should be substantially limited and the demands of surgical aseptic enhanced. In purulent wound infection the staphylococcus and representatives of the intestinal group of microorganisms were the most common bacterial associations cultured. For the last year the appearance of staphylococcus in the monoculture from the infected wounds increased. Various antibiotics, their combinations with each other, sulfanilamides or nitrofuranic preparations, depending on the microflora sensitivity to them and concentration created in the focus of infection, are used in the treatment of purulent infection. The success of antibacterial therapy has been shown to depend on the rational use of antibiotics in complex with other methods of conservative and operative treatment and drugs which stimulate the organism reactivity.

"Investigation of Paramagnetic Shifts in the PMR Spectra of Isoquinoline Coordinated with Nickel Diallyldithiophosphate"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 18, No 10, Oct 73, pp 2692-2695

Abstract: Paramagnetic shifts of isoquinoline in its complex with nickel diallyldithiophosphate [NiDADTP] have been investigated by the dilution method in large excess of the ligand. By the method of isomolar series the composition of the isoquinoline-NiDADTP complex has been established as 1:2, its configuration being that of a distorted octahedron. The data on paramagnetic shifts have been used to calculate spin densities at the hydrogen atoms in isoquinoline. An assumption has been made that the dislocation of spin density occurs principally along the amine σ -bonds.

ACUTE GASTRODUODENAL ULCERS AND THEIR COMPLICATIONS

By V. P. Melnikova, V. I. Filin, M. G. Kamenchik and M. A. Samoylova

The work is based on the study of case reports of two recovered and 66 died patients in whom acute erosion and ulcer of the stomach and duodenum were revealed. In 33 patients there were multiple erosions and ulcers, in the remainder — single. Of 44 patients with complicated acute ulcers in 28 patients these were the principal cause of death, while in 14 patients they accelerated the inevitable lethal issue. Two patients have recovered one after gastrectomy and the other — after suturing mucosa around the bleeding ulcer and ligation of the left gastric artery.

"Use of Ultrasound to Increase Arbovirus Antigen Activity in Serological Tests in Vitro"

Moscow, Voprosy Virusologii, No 3, May/Jun 1973, pp 356-360

Abstract: An ultrasonic technique to increase antigen activity was tested on five groups of arbovirus antigens. Antigens prepared from suckling mouse brain by the sucrose-acetone and freon methods, or in chick fibroblasts without preliminary processing, were subjected to 30-40 sec of 20,000-25,000 Hz ultrasonic treatment. Titers determined before and after treatment by hemagglutination inhibition (HAI), complement fixation (CF), and agar gel diffuse precipitation (AGDP) were compared. For group A and B arboviruses CF and HAI titers increase 4-8 times after treatment, while AGDP titers remained unchanged. In the Kemerovo-Bunyanvera-California group, the CF titers increased by 2-4 times, and no change was observed in HAI titers. CF titers increased 2-8 times for all but Neapolitan arbovirus of the Phlebotomus group.

1/2

USSR

GAYDAMOVICH, S. Ya., et al., Voprosy Virusologii, No 3, May/Jun 1973, pp 356-360

The only HAI response in this group was by Bujaru arbovirus, and only after treatment the AGDP titers increased in a few cases. Ultrasonic treatment had an especially favorable effect on CF and AGDP titers in the Uukuniemi group, while changes in HAI titers were less pronounced. Thus ultrasonic treatment normally facilitates antigen activity in CF and HAI reactions and has a variable effect on the AGDP reaction. Treated antigens did not lose specificity. It is concluded that ultrasonic treatment can be used not only to increase titers but also to reveal titers of relatively inactive antigens.

"New Arbovirus Sunakh from the Uukuniomi Group"

Moscow, Voprosy Virusologii, No 1, Jan/Feb 71, pp 21-25

Abstract: Isolation of the arbovirus Sunakh in the USSR is described for the first time. The virus was obtained from the hearts and lungs of black-birds (*Turdus merula*) collected in Azerbaydzhan. The virus was similar to but not identical with Uukuniomi, as shown in the agar gel diffusion test, but not by the complement fixation test. The isolated virus was pathogenic for suckling white mice. An incubation period of 11 days was found upon intracerebral, which in subsequent passages was reduced to 96 hours. Mice 1-3 days of age were most susceptible. An antigen for hemagglutination reactions was prepared from suckling mouse brains by the sucrose-acetone method. The titor of this antigen did not exceed 1:64. Subsequent workup with Tween-80 and ether raised the titor to 1:256-1:512. When the antigen was prepared by the freon method, the material was enriched with Tween-80 and ether and 1/2

"Isolation of Marburg Virus From the Kemerovo Group in the Moldavian SSR"

Moscow, Voprosy Virusologii, No 6, 1972, pp 709-711

Abstract: A virus isolated in 1971 from an *Exocoecia ricinus* pool collected from sheep in the Moldavian SSR, named Marburg by the authors, was lethal to 2-4 day mice and not so to 3-4 week mice. The virus passed through a 100 nm pore filter but was retained at 50 nanometers. Sodium dodecylsulfate and ether had little effect on virus titers. Inasmuch as it was impossible to obtain a hemagglutinating antigen to the virus by usual methods, identification studies were carried out by the complement-fixation reaction. Tests with immune rabbit fluid reactive to several arboviruses were positive only for the Kemerovo group. Moreover, within that group the most pronounced cross-reaction was with the Tribech subgroup. Thus it is demonstrated that Marburg virus belongs to the Kemerovo-Tribech group. Apparently *E. ricinus* plays an important carrier role in the infection cycle.

"The Effects of Ultrasound on the Functional State of the Frog Retina as Indicated on Electroretinograms"

Yerevan, Biologicheskij Zhurnal Armenii, Vol 23, No 12, pp 50-59

Abstract: The effects of ultrasound waves on biological organisms are especially interesting since neither man nor animals have special receptors for these waves. In this study electroretinograms (ERG) were recorded from frog eyes before and after the frogs were exposed to 20,000 Hz of ultrasound waves of an intensity of 5 W/cm². In the first group, frogs were irradiated with the ultrasound waves until they died; the average survival time was 12-13 min. The second group was irradiated for 10 min. The ERG taken 1 hour later showed significant shifts in the "V" waves; the frogs died in 3-8 days. The third group was irradiated for only 8 minutes, and the frogs survived. The ERG showed definite shifts in all its components: the amplitude of the waves was markedly decreased, and new waves appeared. Complete normalization of the ERG took place in 1-2 months. Repeated irradiation under identical conditions induced similar but less pronounced shifts which disappeared in 10-20

"Gradient Method of Guidance Correction For Solving a Boundary Problem"

Uch. Zap. Tsentr. Aerogidrodinam. In-ta (Scientific Writings of the Central Aerohydrodynamics Institute), Vol 3, No 2, 1972, pp 77-85 (from Referativnyy Zhurnal--Raketostroyeniye, No 8, 1972, Abstract No 8.41.84)

Abstract: The gradient method of plotting the correction of guidance functions and parameters is examined which, in the linear approximation, provides a specified change in the boundary conditions vector at the right end of the trajectory. A comparison of the results of a number of works on direct methods of optimization is conducted in which this problem is examined. Plotting of guidance function corrections in the class of piecewise-constant functions was examined. Results of calculations for the problem on guidance by angle of attack, providing the design of aircraft at a given point, are presented as an illustration. Phosalon in Fruit and Vegetable Products"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 8, No 9 (83), Sep 70,
pp 40-42

Abstract: Phosalon is a new organophosphorus insecticide of comparatively low toxicity for warm-blooded animals. This chemical is based on O,O-diethyl-S-(6-chlorobenzoxazolinyl-3-methyl)-dithiophosphate, and is a promising substitute for DDT in combatting aphids, the lesser apple worm, grape pests, mites and other insects. The authors of this article describe a chromatophotometric method which they have developed for determining phosalon in apples, pears and grapes. The method is based on acetone extraction of phosalon residues with subsequent redistribution from the acetone:water system (1:2) into chloroform, chromatographic separation, and identification on a thin layer of silica gel. After acetone elution of the

Kiev, Akademiya Nauk Ukr SSR, Poroshkovaya Metallurgiya, No 7, Jun 72,
pp 1-4

Abstract: A carbonyl method for obtaining iron-nickel-molybdenum powders containing from 0.5 to 5.0% Mo is described. In order to increase the molybdenum content in the powder, an organic solvent such as $Ni(CO)_4$, $Fe(CO)_5$, $Mo(CO)_6$, or acetone is added to the initial carbonyl iron-nickel mixture, or the temperature of the latter is raised. Articles with high magnetic properties are produced from carbonyl iron-nickel-molybdenum powders.

"Motion of a Solid Particle in Head-on Gas Jets"

V sb. Teplo- i massopereenos v apparatakh s dispersn. sistemami (Heat and Mass Transfer in Devices With Disperse Systems--collection of works), Minsk, "Nauka i tekhn.", 1970, pp 83-91 (from RZh-Mekhanika, No 4, Apr 71, Abstract No 4B920)

Translation: The motion of a solid particle in opposed gas jets is analytically considered for the self-similar, transition and Stokes regions of the law of resistances. Generalized analytical relationships are found which permit approximate calculation of the basic parameters of motion of the particles in the acceleration section and in the zone of collisions of the jets. It is shown that use of the method of opposed jets makes it possible to increase the stay of the solid phase as compared with ordinary flows of a gas suspension. Authors' abstract.

"On the Degree of Blackness of Quartz Glass"

Moscow, *Teplofizika Vysokikh Temperatur*, Vol 10, No 2,
Mar-Apr 72, pp 279—284

Abstract: The degrees of blackness of pure quartz glasses were calculated on the basis of measured values of the spectral absorption coefficient k_λ and the refraction index n_λ . Relations of k_λ and n_λ to spectral, integral, directed, and semi-spherical blackness degrees of a plane layer of finite thickness were derived by solving the equation of radiation transfer. The temperature dependence of k_λ was previously found for the $2.5\text{--}5\mu$ region, where quartz glass possesses a notable transmission. For the $\lambda > 5\mu$ region, the transmission of quartz glass is unimportant and the refraction and absorption indices were approximated by simple algebraic functions. The reflection coefficients of the

1/2

USSR

MEN', A. A. and SETTAROVA, Z. S., *Teplofizika Vysokikh Temperatur*, Vol 10, No 2, Mar-Apr 72, pp 279-284

layer boundaries for s- and p-polarization components were calculated from Fresnel formulas considering a strong absorption band of valence Si-O-Si oscillations. The results showed a strong dependence of the spectral blackness degree on temperature in the regions of translucence and high absorption. Deviations from the Lambert law of absorption are most expressed by low optical thickness. By wave lengths over 5μ , the Lambert law is satisfied anywhere for angles of 0--55 deg., except in the 7--11 μ region. The same regularity is observed for the integral blackness degree. In proportion to the temperature increase from 700 to 1100 °K, the integral blackness degree of a one cm thick quartz glass (brand KV) decreases from 0.74 to 0.55. Comparative results of KV and KI quartz glasses in the 2.5--3 μ region are presented. Six illustr., six formulas, one table, thirteen biblio. refs.

Fizicheskaya Khimiya Okislov (Physical Chemistry of Oxides), Moscow, "Nauka," 1971, 189 pp.

Translation of Annotation: This collection presents review articles by prominent scientists which reflect the present state of the main trends in the physical chemistry of oxides in the USSR and abroad, i.e., the kinetics and thermodynamics of the processes of metal oxidation and reduction, the relationship between the structure and composition with various physico-chemical properties, and the nature and specific properties of nonstoichiometric oxides.

This publication is intended for a wide circle of researchers, i.e., chemists and physical chemists, metallurgists, engineering and technical personnel of ferrous and nonferrous metallurgy, and instructors and students of chemical and metallurgical higher educational institutions.

ABSTRACT. AN INTERPRETATION WAS PERFORMED OF
CONCN. DEPENDENCE OF SURFACE TENSION OF BINARY METALLIC MELTS IN A
COMPLEX MODEL. THE NONPARTICIPATION OF INTRACOMPLEX BINDING ENERGIES IN
THE TOTAL SURFACE TENSION OF THE MELT AND THE DEVELOPMENT IN THE SURFACE
TENSION OF ONLY WEAKER INTERACTIONS BETWEEN THE COMPLEXES AND THE ATOMS
OF THE RESIDUAL COMPONENT WERE ASSUMED IN THIS INTERPRETATION. THE
PARAMETERS FOUND FOR SEVERAL SYSTEMS ARE TABULATED. IN THE OPINION OF
THE AUTHORS, THE PROPOSED MODEL FOR THE STRUCTURE OF BINARY METALLIC
MELTS IS RATHER GENERAL, AT LEAST AT 1ST GLANCE. THE FOLLOWING SYSTEMS
WERE CONSIDERED: PD,NI, PD,CO, PD,CU, SN,CI, AND SN,PB. FOR THE SN,BI
SYSTEM, THE COEFF. OF THE WEAKENING OF THE BI,BI BOND WAS EQUAL TO ZERO.
FACILITY: INST. MET., SVERDLOVSK, USSR.
