Reaction of the obtained acid dichlorides with ethanol in the presence of pyridine yields corresponding diethyl phosphonates. Some acid dichlorides (I-IV), (XII) react with ethylmagnesium bromide yielding 2-chloro-2-alkenyl and alkynyl phosphine oxides. Properties of all prepared compounds along with their PMR and NMR are given.

"Dipole Moments of Derivatives of Trivalent Phosphorus Which Contain a
Dioxaphospholane Ring"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 11, Nov 1971, pp 2,431-2,434

Abstract: In trivalent phosphorus compounds, hybridization of the phosphorus atom varies readily in response to change in the type of substituent, and thanks to this the phosphorus may exhibit bifilarity. However, there is very little published information on variation in the dipole moments of compounds containing trivalent phosphorus. The present study, based on the dipole moment method, is intended to show the mutual effect of atoms in compounds containing dioxaphospholane rings. Data of electrographic research on molecules of 2-chloro-1,3,2-dioxaphospholane and triethyl phosphite were used to compute dipole moments. The group moment of the dioxaphospholane cycle was estimated from M. J. Aroney's data. Moments of the phosphorus-halogen bonds were determined from the dipole moments of the corresponding phosphorus trihalides. Laboratory measurements were made using dilute solutions in benzene at 20±0.05°. All experimental and calculated data are included in the paper. It is concluded that increase in the electron-acceptor capacity of the substituents is accompanied by an increase in the dipole moment.

"Dipole Moments and the Structure of Alkenylphosphines and of the Derivatives
of Phosphonous Acid"

Leningrad, Zhurnal Obshchey Khimii, Vol 41 (103), No 4, Apr 71, pp 862-865

Abstract: Dipole moments were used in a study analyzing the distribution of electron density in alkenylphosphines and in derivatives of alkenylphosphonous acids. Replacing an ethoxy group in triethyl phosphite by a vinyl group led to a slight drop of the dipole moment, as did the replacement of α or β hydrogen atoms in $(C_2H_5O)_2PCH:CH_2$ by methyl groups. Replacement of a $(C_2H_5)_2P$ group by $[(CH_3)_2N]_2P$ has practically no effect on the dipole moment. In general the electron state of the phosphorus atom in above compounds depends on the substituents. As the p character of the unshared pair of electrons of the phosphorus atom increases, its acceptor capacity is decreased.

"An Instrument for Integral Hygienic Assessment of Noises"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 7, 1973, pp 48-50

Abstract: A noise exposure meter developed by the authors (Inventor's Certificate No 290305) can be used to register noise produced within a large area or that experienced by a single worker over long periods of time without attendance. It employs a mercury capillary coulometer-integrator as the memory. An amplifier need not be used at noise levels above 100 db. Tests with the meter showed that it has a sensitivity of 10 μ amps at 100 db and can be used continuously at this level for 680 hours. Cumulative noise is read out in arbitrary units or in μ w/hr/cm². The integral noise assessment criterion provided by this instrument would be of value in public health studies when combined with the noise characteristics utilized traditionally (intensity, spectrum).

"Long-Term Photoscopic Memory"

USSR Author's Certificate No 260926, filed 7 Oct 68, published 10 Jun 70
(from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 6,
Jun 71, Abstract No 6 B325 P)

Translation: A long-term photoscopic memory designed for storing, retrieving, and selecting a symbol image is proposed. The memory contains a light spot commutator -- for example, a cathode ray tube -- a projection objective with telecentric behavior of the beams in the image space, a lens raster information unit, a fast collective, a transmitting cathode ray tube with storage -- for example, the superorthicon type and digital and analog tracking systems for setting the spot on a given address. The memory is distinguished by the fact that to prevent charging the target when retrieving the required microframe, the device contains an electronic image modulator in the transfer section of the transmitting TV-tube. In order to insure a broad range of variation of the capacity of the TV frame and the selection rate, the target of the transmitting TV tube is executed in the form of a metal fiber disc with a coefficient of secondary emission

BRODOLIN, L. I., et al., USSR Author's Certificate No 260926, filed 7 Oct 58, published 10 Jun 70 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika , No 6, Jun 71, Abstract No 6 B325 P)

of the side turned toward the photocathode equal to one. In order to simplify the design and insure the possibility of recording the service information used during operation of the tracking systems in the microframe, the device contains a fiber, vacuum-tight coherent light guide with a cross section equal to the size of the symbol in the focal plane of the collective. The photocathode of the transmitting TV tube is applied to the output end of the light guide, and the input ends of the light guides connected with the photomultipliers of the tracking address system are arranged around the perimeter of the input end. In order to insure the required levels of light flux from the standing light spot, the light spot commutator executed in the form of a cathode ray tube contains a built-in screen which vibrates in its own plane. "Engineers and Doctors"

Moscow, Sovetskaya Rossiya, 29 Sep 70, p 4

Abstract: A nontechnical discussion is presented of a visit to the Moscow Electromedical Apparatus Plant. Sixty types of instruments are produced at the plant, including microwave instruments for medical therapy, diagnostic devices, dental equipment, equipment to monitor the electrical activity of the stomach, and an echo-device for sonic probing of the brain. This instrument whose operation is based on the fact that health and diseased tissues reflect sound differently, is being used, for instance, to delineate the contours and topography of brain tumors. The plant is also producing transistorized electrosleep devices. In addition to the above highly sophisticated devices, such items as operating tables and oscillographs are produced. Cooperation between the engineers who design this equipment and the medical staff who will use it is very close. The engineer working on an instrument must himself be well-versed in the particular medical specialty. The objective in all cases is to produce a series of a given device rather than just a single instrument. Frequently, 500-1,000 instruments of a given type are required.

"The Distribution of Models of Spatially Homogeneous Microbiological Cultures"

Mat. Modelir. Mikrobiol. Protsessov [Mathematical Modeling of Microbiological Processes -- Collection of Works], Pushchino-na-Okhe, 1973, pp 127-169 (Translated from Referativnyy Zhurnal Kibernetika, No 9, 1973, Abstract No 9V284)

Translation: Cultures of micro-organisms, growing in a strongly agitated medium, are presently widely used for scientific research and production purposes, since with sufficient agitation, all cells are under practically identical conditions. The mathematical description of the kinetics of the growth of such cultures is frequently produced using the apparatus of ordinary differential equations and achieves good adequacy to the actual process, particularly for the case of stable growth under flow conditions.

However, in a number of situations it becomes necessary to consider the differences between the properties of individual groups of cells in the culture. This article studies models allowing these differences to be considered, which is achieved by a transition to systems with distributed parameters, described by differential equations with partial derivatives.

"Consumption of Oxygen and Water Associated With the Growth of Microorganisms"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 2, Mar/Apr 72, pp 245-254

Abstract: Two important aspects of industrial culturing of microorganisms are analyzed: the consumption of oxygen and water as a function of a) v_5 , the type of carbon substrate used (that is, the degree of reduction present in the substrate) and b) y_c , the efficiency with which the microbes utilize the substrate. The latter factor is defined as the ratio of the weight of carbon in the synthesized biomass to the weight of carbon in the utilized substrate, while v_5 is determined by the average reduction of one atom of carbon in a molecule of substrate.

K, the unit consumption of oxygen, that is, the amount of oxygen consumed during the synthesis of 1 gram of dry biomass, was found to be a linear function of v_5 and y_c , given by the ratio $\frac{v_5}{y_c}$. In order to decrease K one must either

1/2

y_c

USSR

MINKEVICH, I. G. and YEROSHIN, V. K., Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 2, Mar/Apr 72, pp 245-254

increase y_c or decrease v_5 . These two values are not independent; y_c depends on v_5 as well as on the type of culturing process used.

With regard to the consumption of water, it was found that both the amount of water supplied to the microorganisms and the amount of water formed during the growth of the biomass could be reduced by the same three methods, all of which increased the concentration of the biomass: 1) increasing the concentration of the substrate in the medium supplied to the cells, 2) increasing the weighted efficiency factor Y_c , and 3) decreasing the unused portion of the substrate.

It was also found that when the speed of the flow of material supplied to the cultivator is lowered, the consumption of both oxygen and water are minimal. However, the speed must not be lowered past a certain critical point, or else oxygen ceases to be the limiting factor and is not completely consumed.

"The Shortest Time for Establishing a Steady State in a Cultivator

Moscow, Biofizika, Vol 15, No 5, Sep/Oct 70, pp 867-872

Abstract: Mathematical relationships are established for the formation of a steady state under optimum conditions of operation corresponding to maximum production of biomass in a continuously operating apparatus for the cultivation of microorganisms (fermenter) with complete mixing, to which a part of the outgoing flow consisting of the biomass and nutrient solution is recirculated after centrifuging. The possibility of shortening the time required for the transitional process taking place before a steady state is established is considered. Formulas are derived for an optimal system of programmed control, by application of which the time that elapses before a steady state is established can be shortened considerably, e.g., from several days to a few hours in the case of cultivation of *Bacterium propioni* Sherman.

"Basis for the Territorial Type of Long-Range Forecasting of Plant Diseases"

Leningrad, Mikologiya i Fitopatologiya, Vol 5, No 1, 1971, pp 55-62

Abstract: Long-range forecasts of plant diseases over a number of years can be made with respect to the time at which the diseases will appear and the territories that will be affected. Forecasts of both epiphytotic and enphytotic diseases can be made; the enphytotic type of forecast is of particular practical importance. Territorial prognoses make it possible to determine in advance the damage from a disease, taking into consideration changes in the system of agriculture in various regions of the country. Determination of potential new areas over which a disease may spread is of particular importance in connection with changes in the method of growing (e.g., introduction of crop irrigation) and introduction of crops into new areas. To obtain the necessary data for long-range forecasts from the phytopathogeographic standpoint, the following studies should be conducted: determination of the location of foci of a disease; study of the extent of the area affected by the disease with annual mapping; differentiation of zones with respect to intensity

of the disease; differentiation of zones with respect to the frequency of epiphytotic outbreaks; estimation of the probability of epiphytotic outbreaks taking into account agrobiological data on the relationship between the pathogenic organism and the host, climatic conditions, and other factors. The procedures to be followed in arriving at forecasts of this type are illustrated by examples of Fusarium wilt of cabbage, downy mildew of sunflowers and of cabbage, leaf rust of barley, and root rot of winter wheat. Maps showing the extent of these diseases in the USSR are included.

MEDICINE

PRESENT STATUS AND URGENT PROBLEMS RELATING WITH HYGIENE OF SCHOOL CHILDREN

[Article by A.A. Minkh, G.M. Serdyukovskaya (Moscow); Moscow, Yatnik Akademi Meditsinskii Naik SSSR, Russkii, No 6, 1972, pp 13-21]

UDD: 611.915

Hygiene of children and adolescents which works on prophylactic problems concerning protection of the health of new generations became an independent branch of social hygiene in 1923, as a special course of instruction on the medical faculties of Moscow universities.

This was based on the fact that there was a significant scope to state measures regarding organization of the public education system and the major tasks concerning improvement of the health of children and adolescents which confronted public health agencies in the early years of Soviet power, as well as that there was need to broaden training of special physicians to provide medical care for the child population.

In the early years of its existence this discipline was called school hygiene, then, because of expansion of the area it dealt with and extension of its influence to different age groups. It was named hygiene of children and adolescents. In 1960, the special Institute of Hygiene of Children and Adolescents was founded and it coordinates scientific research in the field in the entire country.

Hygiene of children and adolescents deals chiefly with development of hygienic norms referable to various aspects in the life of children, directed toward providing optimum environmental conditions that would not only preserve but also strengthen health. For this reason, the chief issues are hygiene of teaching and upbringing, industrial hygiene for working adolescents, hygiene of school and children's institution construction, investigation of health and physical development of children and adolescents, and hygiene of physical training.

Development and formation of the child depend in many respects on environmental conditions, upbringing, work and rest schedule, and conditioning of the organism. Here, the environment should not be interpreted in the narrow sense, but as a complex set of natural, living, and industrial factors without which man does not exist.

CHANGES IN SOME INDICES OF PYRIDOXINE AND NICKOTINIC ACID METABOLISM UNDER PHYSICAL STRESS

Article by Ye.M. Zhuburkin, A.A. Minkh, Institute of Nutrition, USSR Academy of Medical Sciences, Central Institute of Physical Culture, Moscow; Moscow, Vestnik Akademii Meditsinskikh Nauk SSSR, Kusslan, No 1, 1972, pp 60-65

In modern athletics rather high physical loads are used which induce significant changes in the functional state of the body, which are greatest in many respects than those known in the earlier literature. Quite often there are two training periods a day: in contests and when training for them athletes perform 2-3 times a day in many types of sports, and this presents great demands to the body and makes it necessary to utilize potential means of expanding the range of adaptation to considerable exertion.

The nutrition factor plays a considerable part in broadening the adaptational capabilities of the organism (A.A. Pokrovskiy; A.A. Minkh, 1967). In this respect, investigation of the role of different vitamins in the process of athletic training is quite interesting. In studies dealing with supply and demand of vitamins for athletes during athletic and heavy physical exercise attention has been focused mainly on vitamins A (I.M. Borilov et al., 1971), B₁ (M.A. Vytchikova), E (Yu.I. Karpukina et al., 1967), and C (Caritler). On the basis of the data submitted by these authors, one could think that the body's vitamin requirements increase when engaged in athletics. In view of the positive correlation between metabolism of vitamins (T. Terrano), it is interesting to investigate the influence of physical loads on indices of metabolism of these vitamins.

As we know, the extent of action of exogenous factors (climate, season, type of activity, diet) has a significant effect on metabolism of vitamins B₆ and PP (N.V. Yeffremov, 1966; I.I. Ibragimov et al.; G.V. Mestrovichskaya et al.). Physiological stress factors do not alter the vitamin requirements to the same degree. Determination of changes in pyridoxine and nicotinic acid metabolism under the influence of physical stress is of interest for establishing norms for these vitamins in the diet during periods of intensive athletic training.

"Hygienic and Occupational-Pathological Aspects of the Biological Effect of Static Electric Fields in Industry"

Moscow, Gigiyena Truda i Professionalnyye Zabolevaniya, No 6, Jun 71, pp 42-44

Abstract: The general level of disease incidence was found to be higher in persons subjected to the effect of static electric fields; there was a higher incidence of particularly acute respiratory diseases in this group than in the control group. In a wood-processing plant, the disease incidence was found to be more than two times that of the control group; the latter group had not been exposed to electrification of the production process. No harmful substances had been found in the air, meteorological factors had been normal and they had been maintained at a normal level by an air-conditioning system. The noise level was 87 decibels and 90-95 decibels respectively. The various differences systems were attributed to the presence of static electric fields in the factories.

"Vitamin A and Physical Loads"

Moscow, Gigiyena i Sanitariya, No 1, Jan 71, pp 42-46

Abstract: Animal experiments showed that physical effort results in an increase in the rate at which vitamin A is used up in the body. A shortage of vitamin A in rabbits not receiving a supplementary dose of it or receiving a supplementary dose of 3 gamma/day while during periods of physical effort lasting for 3-5 hrs per day resulted in deterioration of their physical condition, which could be improved by administering 7.5 or 15 gamma/day of the vitamin. Sixty percent of students undergoing training in skating, whose daily intake of vitamin A was 2,277-2,475 gamma, showed a reduction of the level of vitamin A in the blood in the initial part of a 42-day training period involving 3-3.5 hrs of physical effort per day. The level of carotenoids was also lowered and the students had an impaired capacity for dark adaptation. A supplementary intake of 990-1,980 gamma/day of the vitamin raised its level in the blood and removed symptoms of vitamin deficiency. A supplementary intake of vitamin A in this range, bringing the total consumption of vitamin A

"Concerning The Effect Of Current Settling In Electron Gun On Minimum Noise Factor Of TWT"

V sb. Vopr. elektron.tekhn. (Problems Of Electronic Technology---Collection Of Works), Issue 2, Saratov, Saratov University, 1971, pp 137-145 (from RZh---Elektronika i yeye primeneniya, No 3, March 1972, Abstract No 3A80)

Translation: The effect is theoretically investigated of current settling [tokosediya] in an electron gun (EG) on the minimum noise factor of a TWT. The conclusion is made that current settling in an EG, in contrast to current settling in the interaction region, does not constitute a serious threat in the sense of a considerable increase of the noise factor of a TWT. Use of special electrodes leading to current interception in the region of the EG is able to prevent current settling inside the delay system, which leads to a decrease of the noise factor. 7 ref. R.M.

"Effect Of Current Interception At Input To Delay System On The Noise Factor Of BWT"

V sb. Vopr. elektron. tekhn. (Problems Of Electronics Technology--Collection Of Works), No 2, Saratov, Saratov University, 1971, pp 146-149 (from RZh:elektronika i yeye primeneniye, No 2, Feb 72, Abstract No 2A158)

Translation: It is known that current subsidence [tokosvedaniye] in the interaction region leads to a significant increase of the minimum noise factor of a traveling-wave tube (TWT). The effect of current interception [tokoparakhvut] on the noise factor of a backward-wave tube (BWT) is analyzed. It is shown that under specific conditions, the minimum noise factor of a BWT is smaller than the noise factor of a TWT. Consequently, during construction of super low noise microwave amplifiers with current subsidence conditions at the input to a delay system it is preferable to use a BWT. V.M.

"Amplitude And Phase Noise Of A TWT Resulting From Low-Frequency Fluctuations Of Current (Summary Of Deposited Manuscript)"

Elektron. tekhnika. Nauchno-tekhn. sb. Elektron. SVCh (Electronic Technology. Scientific-Technical Collection. Microwave Electronics), 1970, No 6, pp 110-111 (from RZh--Elektronika i yeye primeneniye, No 10, October 1970, Abstract No 1CA162)

Translation: The paper considers the high-frequency noise of the output voltage in a TWT caused by low-frequency fluctuations of the electron beam current. It is assumed that the upper limit of the fluctuation frequency is considerably below the signal frequency so that a calculation of the spectrum of low-frequency amplitude and phase noise can be conducted quasistatically, i.e., it can be reduced to a calculation of the indicated magnitudes which are determined by a static solution. The following conclusions were made on the basis of the investigation conducted: 1) The low-frequency fluctuations of the current lead to low-frequency fluctuations of the amplitude and phase of the output voltage of the TWT; 2) The basic sources of modulation of the low-frequency noise are the noise of current distribution and the ionization effect, and at sufficiently low frequency-- the flicker effect; 3) The spectrum of the amplitude and phase noise resulting from the low-frequency current fluctuations is significantly determined by the operating conditions of the TWT. Summary.

Derivatives of Tellurium. V. Investigation of the Complex Formation of
TeCl₄ With Schiff's Bases"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 9, Sep 73, pp 1943-1947

Abstract: Novel complex compounds of TeCl₄ with benzalanilines and β-hydroxynaphtalanilines have been synthesized. On the basis of IR spectroscopic study of these complexes the conclusion was reached as to the localization of the coordination bond in azomethine molecules. It has been shown that the equimolecular complexes are energetically more feasible and their structures have been discussed. The heats of complex formation reactions are correlated with the substituent constants in the aldehyde (σ⁺) and aniline (σ^o) nuclei of the azomethine molecules.

"Indole Chemistry. XXI. Nitration of 3-Acylindoles"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 11, Nov 71, pp 1506-1511

Abstract: In nitration of 3-acyl- and 3-carbetoxyindoles with various nitrating agents, relative prominence of hydrogen atom substitution in position 4, and replacement of the acyl radical by a nitro group in position 3, very largely depends on the immediate conditions of the experiment. Here the authors compare available experimental data with reactivity figures obtained with use of the LCAO-MO method (linear combination of atomic and molecular orbitals). It is concluded that hydrogen atom substitution in the benzene ring of the models studied represents an electrolytic attack on the unprotonated molecule of the indole compound.

"Hygienic Evaluation of the Air in Places Treated With Chlorophos"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 8, 1971,
pp 17-20

Abstract: Analysis of 250 air samples in a special experimental chamber and of air samples from well-ventilated places in cafes, hostels, hospitals, and restaurants showed that 3 hours after treatment with a 5% water solution of the organophosphorus insecticide chlorophos, the air contained no more than 0.5 mg/m³ of the compound (maximum permissible concentration). With very poor ventilation it took as long as 24 hours before the concentration of the insecticide dropped to the permissible level. The external temperature was an important factor. When the outdoor and indoor temperatures differed considerably and the windows were open, all traces of chlorophos disappeared within one hour of treatment.

Goncharov, V. K., A. N. Loparev, and L. Ya. Min'ko.
Self-rolling pulsed optical discharge in an erasive laser
plasma. ZHETF, v. 62, no. 4, 1972, 2111-2114.

A variant on the optical plasmaatron is described in which a self-igniting optical discharge is obtained from irradiation of a target surface. The technique was to defocus the incident beam such that the focal point was several millimeters above the target surface; vapor products from the surface, traveling at about 100 m/sec, would ignite on reaching the focal point and provide a "hanging" optical discharge for the remainder of the laser pulse. The experiment cited used an Nd glass laser at 1.5 ps pulsewidth and generating relatively low surface intensities on the order of 10^6 w/cm^2 . Various metals and dielectrics were tested as target materials, including graphite, tantalum, brass and a type PCD-40 alloy. Depending on the material, a stable discharge was achieved in a 10 - 20 mm range above the target surface; spectral studies show discharge temperatures at 22,000°K. Streak photos of the discharge development are given; Fig. 3 shows one form of the discharge.

Balanov, V. A.; V. K. Goncharov, and L. Ya. Min'ko, Powerful optical erosion plasmatron, ZhPZh, v. 16, no. 5, 1972, 931-934.

A versatile laser-driven plasmatron is described which may be compared to the one described previously by Goncharov et al in this report. In the present design the simple chamber shown in Fig. 1 was used to

Fig. 1. Laser plasmatron
1 - quartz window; 2 - chamber;
3 - target material; 4 - exit nozzle

generate a plasma jet from any given target material, with the plasma driven out through the nozzle by generated pressure. By varying pulse parameters, chamber dimensions, fill gas, etc., a wide range of plasma jet characteristics can be obtained, ranging from subsonic to supersonic. The authors used an rd glass laser at 0.8 millisecond pulses of 5 kj peak energy, in a quasi-cw regime, to develop target surface densities on the order of 10^6 w/cm^2 . Glass tentlike was used as target material, and helium at pressures from 5×10^{-2} ton to several atmospheres served as fill gas. The many possible variations in jet parameters are discussed and both high-speed and streak photos are given of jet propagation. Table I compares results of two modes. The results generally show the versatility of this type of low temperature plasmatron.

"Generation of High-Speed Plasma Fluxes by a Pulse Accelerator on the Basis of the Phenomenon of Electric Detonation of Conductors and Dielectric Erosion"

Minsk, Doklady Akademii Nauk BSSR, Vol XVI, No 2, 1972, pp 115-117

Abstract: A study was made of a pulse generator of a moving plasma created by electric detonation of conductors of defined form in a bounded volume. The described plasma generator can operate in two versions -- on the basis of electric detonation of conductors as a source of a metal plasma or using pulse surface discharge where the plasma is formed as a result of erosion of the walls of the discharge chamber and the electrodes. The described pulse plasma generator permits the creation of incompletely expanded supersonic erosion plasma jets at atmospheric pressure with given gas dynamic characteristics determined by the discharge conditions and parameters.

Utilization of the phenomenon of electric detonation of conductors of a defined form under conditions of operating the plasma generator with an

1/3

USSR

YEL'YASHEVICH, M. A., et al., Doklady Akademii Nauk BSSR, Vol XVI, No 2, 1972, pp 115-117

auxiliary gap introduced into the discharge chamber permitted flows of a low-temperature metal plasma of any given chemical composition to be obtained with relatively high efficiency of utilization of the stored initial energy. The energy in the discharge gap for $V = 4$ kilovolts and $C = 200$ microfarads (mode I) was calculated from the current and voltage oscillograms as 1.3 kilojoules with an initial energy of 1.6 kilojoules. This essentially exceeds the energy contributed in the case of operating the generator with an external auxiliary gap (0.5 kilojoules). Optimization of the discharge conditions and the geometry of the discharge chamber and, consequently, the detonated conductor permitted incompletely expanded supersonic plasma jets to be obtained at atmospheric pressure with an escape velocity of $v = 25$ km/sec for a contributed energy of 1.3 kilojoules (mode I). The presence of intense continuous and linear spectra is a characteristic feature of the emission of the erosion plasma ($V = 5$ kilovolts, $C = 1,950$ microfarads (mode II) without electric detonation of the conductors) formed inside the discharge chamber. Spectroscopic measurement of the plasma temperature and concentration ($T = 6,000^\circ \text{K}$, $n_0 = 5 \cdot 10^{16} \text{ cm}^{-3}$)

"Peculiarities Of The Effect Of Emission Of Rhodamine Laser On Absorbing Materials"

Kvantovaya elektronika, Moscow, No 5, May 71, pp 112-116

Abstract: A study is conducted of the damaging action on absorbent materials of emission generated by a laser based on a standard solution of Rhodamine-6 Zh. Generation excitation was accomplished by two series-connected IFP-2000 lamps located in a magnesium oxide cylindrical illuminator. A battery of IM-50-3 capacitors with a capacitance of 56 microfarad at a voltage of ~ 10 kv was used for energy storage. The duration of the pumping pulse was 120 microsec (at a 0.1 level). An energy output of 12 joule with a generation duration of ~ 55 microsec was assured. The maximum flux density of the emission amounted to $3 \cdot 10^6$ watt/cm². As a result of the action a quasi-stationary ultrasonic plasma jet is formed with a relatively large angle of emergence. In it a stationary shock wave is formed, the configuration of which is determined by the geometry of the jet's emergence and has a dome-shaped form. With the aid of high-speed spectral filming it is established that excitation of the spectrum primarily takes place in the stationary shock wave. A discontinuous

1/2

USSR

GORCHAROV, V. K., et al., Kvantovaya elektronika, Moscow, No 5, May 71, pp 112-116

structure of the plasma jets is displayed, probably resulting from the explosion-formed (volumetric) character of vaporization. The recurrence frequency of the individual microbunches during laser action on lead (or tin-lead solder) amounts to ~ 1 MHz (the flux density of the emission is $\sim 3 \cdot 10^6$ watt/cm²). The exhaust velocity of the plasma jet was measured. Pressures in the zone of action is evaluated. Some peculiarities of the action on the absorbing material are studied. 82448a Technological production and properties of granular oxide refractories. Poluboyarinov, D. N.; Ballezovich, V. L.; Lemeshev, V. G.; Minkov, D. B.; Makarova, I. S.; Vino-

gradova, I. V. (Mosk. Khim.-Tekhnol. Inst. im. Mendeleeva, Moscow, USSR). *Ogneupory* 1970, 35(1), 11-14 (Russ).

The technol. of granular oxide refractories is based on the use of coarse-dispersive powders prepd. from presintered or elec. fused oxides. The ruling opinion that coarse-granular powders of pure elec. fused oxides are inert at sintering and that they do not form sufficiently dense and solid ceramics is faulty. If high pressures (1000-2000 kg/cm²) are used, and if the min. amt. of fine-dispersive powders of an oxide is added to the ceramic mass or even no binder is used when the porosity proper for refractories (i.e. 15-20%) is reached at the annealing temps. ordinary for a given oxide. The strength and deformation properties of these products are satisfactory. The deformation temp. of porous granular refractories under load prepd. from pure elec. fused oxides is 50-100% lower than that of nonporous materials. Refractories prepd. from elec. fused oxides show a substantially lower strength, however, sufficient for service at high temps. From the powders of elec. fused oxides one can prep. high-class products comparable in properties with products manufd. from powders of sintered oxides. The main technol. parameters of the manuf. of oxide refractories are practically the

1/2

REEL/FRAME

19781939

AP0046628

same for both initial materials. The technol. by using sintered oxide powders needs: the preliminary thermal treatment of initial components (Al_2O_3 , MgO , ZrO_2), the fine grinding, the briquetting, the annealing of briquets, and their crushing and partial grinding. The elec. fusion permits using raw initial powders; further, it makes possible to realize the stabilization of ZrO_2 with CaO or the synthesis of complicated compds., namely spinels, zirconates, silicates, and other highly fire-resistant substances.

"Redistribution Along P-N Junction Of The Radiation Of Injected Light Sources Of Gallium Arsenide In A Magnetic Field"

Uch.zap.Ural'sk.un-ta (Scientific Notes, Ural University), 1971, No 118, pp 45-51 (from RZh--Elektronika i yeye primeneniye, No 3, March 1972, Abstract No 3B291)

Translation: The paper reports on a study of the change of intensity of spontaneous radiation along a p-n junction in a transverse magnetic field as a function of the geometry of the diode, the intensity of the magnetic field, and the current across the specimen. The resolution amounted to 3-5 micrometer. In the magnetic field pronounced redistribution was observed of the radiation at the edges of the specimen, the relative magnitude of which practically did not depend on the width of the diode. 4 fig. 8 ref. "Effect Which the Directivity of a Unit Radiator Has on the Characteristics of an Equidistant Line Antenna Array When Maximizing the Directive Gain or Slope of the Sum or Difference Radiation Patterns"

V sb. Antenny (Antennas--collection of works), vyp. 9, Moscow, "Svyaz", 1970, pp 3-12 (from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12B43)

Translation: The author studies the effect which the radiation pattern of a unit radiator $f(\nu)$ has on the optimum pattern, the directional gain or slope, and the current distribution of an equidistant line antenna array with half-wave spacing between radiators $d = 0.5\lambda$ when maximizing the directional gain or generalized slope of the sum or difference radiation pattern. By using orthogonal polynomials, the investigated characteristics and parameters are obtained in explicit form and their asymptotic behavior is found in the case of a large number of radiators. Arrays with an odd $(2N+1)$ number of radiators are analyzed in detail. In particular, for certain $f(\nu)$ such systems degenerate into arrays with $N+1$ radiators with double spacing $d = \lambda$. Three illustrations, bibliography of four titles. Resumé.

"On a Class of Optimum Linear Equivalent Antenna Arrays With Additive or Subtractive Radiation Patterns"

V sb. Antenny (Antennas--collection of works), Vyp. 8, Moscow, "Svyaz", 1970, pp 3-17 (from RZh-Radiotekhnika, No 7, Jul 70, Abstract No 7B32)

Translation: The optimum pattern $F^0(x) \left(1 - \cos \frac{\pi d}{\lambda} \cos \nu \right)$ minimizes the integral

$\int_0^1 F^0(x) (1-x^2)^{-1/2} w(x) dx$, where the structure of the weight function $w(x) > 0$ depends on

the distance d between the elements of the array and on the required spatial re-distribution of the radiated power. With adequate selection of $w(x)$, many of the known problems of optimization coincide with the problem under consideration. The function $w(x)$ generates a system of orthogonal polynomials $P_n(x)$ in terms of which $F^0(x)$ is expressed, while the corresponding currents are expressed in terms of their coefficients. This type of computational procedure is especially convenient where

1/2

MINKOVICH, B. M., Antenny, Vyp. 8, Moscow, "Svyaz", 1970, pp 3-17

the $p_n(x)$ are known in explicit form. In particular, when $d = \lambda/2$ and $w(x) = (1-x^2)^\lambda F^0(x)$ are expressed in terms of the derivatives of Gegenbauer polynomials. The asymptotic form of $F^0(x)$ and current distributions are found from the known asymptotic behavior of the $p_n(x)$. Two illustrations, bibliography of 16 titles. Resumé.

"Sum and Difference Radiation Patterns with Minimum Fringe Radiation"

Moscow, Radiotekhnika i Elektronika, Vol XV, No 7, 1970, pp 1374-1384

Abstract: This article contains an investigation of sum and difference radiation patterns of linear and circular apertures with minimum fringe radiation or with maximum proportions of power within the limits of the main lobe. The solution is presented in terms of spheroidal functions the asymptotics of which made it possible to obtain analytically simple expressions both for the radiation patterns and for the amplitude distribution.

Significant improvement in the structure of the fringe radiation is achieved when building antennas with radiation patterns which are optimal in the sense of maximum radiated power within the limits of the main lobe or minimum fringe radiation. When solving problems related to this concept as applied to sum and difference radiation patterns of linear (rectangular with separating amplitude distribution) and round apertures, the solutions obtained are compared, and patterns close to optimal described by expressions of the type

1/2

USSR

MINKOVICH, B. M., et al, Radiotekhnika i Elektronika, Vol XV, No 7, 1970, pp 1374-1384

$\Lambda_{1/2}(\sqrt{v^2 - B^2})$, which can be especially useful in engineering practice, are found. Fourier and Hankel transformations from the amplitude-phase distribution are used to express the patterns. Graphs of the difference functions and quasioptimal patterns of the round aperture and the corresponding amplitude distributions are presented for values of B from 0 to 5.

INVESTIGATION OF THE SPECTRA OF SOME STOCHASTIC
OPERATORS ARISING IN THE LATTICE GAS MODELS

R. A. Minlos. Ya. G. Sinai

The spectrum of the transfer-matrix A_L is investigated for the case of the general lattice models with finite interaction. The limiting stochastic operator P_∞ is constructed as the limit of the stochastic matrices P_L , which are obtained from the transfer-matrix A_L by means of a natural normalization. The first and the second invariant subspaces of the operator P_∞ with small values of the parameter β are found. The spectrum of the operator P_∞ in the first subspace coincides with the values of a certain function $a(\lambda)$ ($0 < \lambda < 2\pi$) while in the second subspace this spectrum contains the values of the function $a(\lambda_1)a(\lambda_2)$ ($0 < \lambda_1 < \lambda_2 \leq 2\pi$) plus perhaps several additional segments. The latter result is in a good agreement with the well-known work by L. Onsager, where the spectrum of P_∞ was found in the explicit form for the case of the Ising model.

"Motor Activity and Daily Energy Expenditure of Students"

Moscow, Gigiyena i Sanitariya, No 11, 1972, pp 56-59

Abstract: Questionnaires and time-and-motion studies were used to analyze the daily routine of over 600 young men and women attending the First Moscow Medical Institute and Moscow Energy Institute. The students were relatively inactive 83% of the time, even during their leisure hours, which they spent mostly reading, watching television, or going to the movies. Only about 7% of all the students engaged in sports of any kind. The women were even less active than the men, the energy expenditure averaging 2290 and 3536 kcal, respectively. The students housed in dormitories tended to be more passive than those living at home. All students, male and female, became more active on Sundays possibly because the body's natural need of exercise is curbed on school days.

Tr. Kuybyshev. Aviats. In-t. [Works of Kuybyshev Aviation Institute], No 48, 1971, pp 222-230, (Translated from Referativnyy Zhurnal, Rakotostroyeniye, No 2, 1972, Abstract No 2.41.185 from the Resume).

Translation: This work presents a mechanism of fatigue rupture, according to which the specimen is looked upon as a set of discrete fiber elements, exerting no pressure on each other. The linear theory of adding of fatigue damage is applied to an individual fiber. With this approach, the accumulation of damage in a fiber is determined by its stressed state, studied considering its loading history. The dependence of stress in the fiber on the rupture number of cycles, the fatigue curve for a crack, can be produced experimentally. Appearance of the first microcrack is interpreted as rupture of the most highly stressed fiber. Thus, if the time corresponding to the development of a crack is known and the process of crack propagation is described, the durability of the specimen can be calculated. 7 Figures; 2 Tables; 3 Biblio. "Calculation of the Supersonic Region of a Three-Dimensional, Nonequilibrium Air Flow Over Bodies"

Moscow, Mekhanika zhidkosti i gaza, No. 5, Sep/Oct 72, pp 124-129

Abstract: Supersonic, nonequilibrium, three-dimensional flow over bodies when there is a plane of flow symmetry present is considered. All flow parameters in the shock layer are assumed given up to a certain surface of the three-dimensional type, i.e., a surface at each point of which the velocity component normal to it is greater than the local frozen velocity of sound. The flow of nonequilibrium gas is consequently investigated only in the purely supersonic region of the flow. Molecular transfer processes are neglected. A sample of a calculation of nonequilibrium air flow over a segmented body is given. It is noted that there has been previously only one published study on the calculation of nonequilibrium three-dimensional gas flow in the supersonic region. This paper investigated the effect of nonequilibrium dissociation in the flow around blunt reverse cone in a supersonic

1/2

USSR

BURDEL'NYY, A. K., MINOSTSEV, V. B., Mekhanika zhidkosti i gaza, No. 5, Sep/Oct 72, pp 124-129

oxygen flow. Pictures of the flow in the distribution of flow lines between the surface of the body in the shock wave and the supersonic region show a different character of the flow from the leeward and windward sides of the flow. On the windward side of the flow the shock wave is very close to the surface of the body and the entire gas flow entering the shock layer in the subsonic flow region close to the curvature and a region of fans of rarefaction waves occurs. The flow temperature then drops sharply leading to freezing of the physicochemical processes and a decrease in their energy contribution to zero. The flow picture is somewhat different from the leeward side. The flow lines passing through the high-temperature region and consequently along which physicochemical processes arising in the flow lead to a considerable change in the composition occupy a considerably greater portion of the shock layer.

"Studying the Supersonic Three-Dimensional Flow Around Segmental Bodies"

Tr. Sektsii po chisl. metodam v gaz. dinamike 2-go Mezhdunar. kollokviuma po mekhanike vzyvaya i reaktivnyushchikh sistem, 1969 (Works of the Section on Numerical Methods in Gas Dynamics of the Second International Colloquium on the Gas Dynamics of Explosions and Reacting Systems, 1969), Moscow, Vol 2, 1971, pp 68-70 (From RZh-41. Raketostroyeniye, Moscow, No 3, Mar 1972, Abstract No 3.41.110)

Translation: The supersonic, three-dimensional flow around bodies of segmental shape has been studied since 1966 at the Institute of Mechanics of Moscow State University under the supervision of G.F. Telenin. In calculating streamlining, methods were used in which the gas dynamics functions on the layers are represented by Lagrangian polynomials with two variables, while a system of ordinary differential equations is solved for the transition from layer to layer in calculating the subsonic and transonic regions of flow. The characteristics method is used for calculating the supersonic region of flow. Since the developed methods are adapted for calculating smooth flows, the contour of the segmental bodies was approximated by a single analytic formula. The approximation used made it possible to calculate the flow around bodies whose contour differs from the contour of segmental bodies.

with a break in the generating line practically in the region of the midsection. Calculations were conducted for numbers $K_{\infty} \geq 5$, angles of attack α up to 30° , various central angles for any spherical segment ($2\theta'$), and various slope angles for the generating line of the rear cone (β). As a result of these calculations, distributions are obtained for the gas dynamics parameters in the shock layer and on the body surface. Shock waves, flow line distribution charts, and an isobar in the flow symmetry plane and on the body surface were constructed. The effect of the real properties of gas on the flow chart, the distribution of gas dynamics parameters, and on aerodynamics characteristics was studied. "Study of Supersonic Three-Dimensional Flow Around Segmented Bodies"

Tr. Sektsii po Chisl. Metodam v Gaz. Dinamike 2-go Mezhdunar. Kollokviuma po Gasodinamike Vzryva i Reagiruyushchikh Sistem, 1969, T. 2 [Works of Section on Numerical Methods in Gas Dynamics, Second International Colloquium on Gas Dynamics of Explosions and Reacting Systems, 1969, Vol 2], Moscow, 1971, pp 68-86. (Translated from Referativnyy Zhurnal, Mekhanika, No 4, 1972, Abstract No 4 B222 by M. G. Lebedev).

Translation: A review is presented of the results of numerical investigation of a supersonic, three-dimensional flow (with angles of attack up to 30°) around bodies with faces consisting of a spherical segment and side surfaces consisting of an inverted cone; the body has slight curvature in the midsection. Calculations of flow around the face and side surfaces were performed by the method of G. F. Telenin (Telenin, G. F., Tin'yakov, G. P., Dokl. AN SSSR, 1964, Vol 154, No 5, pp 1,056-1,058 -- RZhMekh, 1964, 6 B212) and the layer method of method of characteristics (Minostsev, V. B., Izv. AN SSSR, Mekhan. Zhidkosti i Gaza, 1967, No 2, pp 121-125 -- RZhMekh, 1967, 8 B190) respectively. The positions of shockwaves, sonic lines, flow lines and isobars are given with flow around the face. The flow structure in the area of the critical point is analyzed in detail. The influence of physical and

chemical conversions on the picture of flow around the face and side surfaces is investigated, as well as the distribution of gas dynamic parameters. The problem of possible influence of viscous properties of the gas on flow around the body is studied and it is concluded that the influence of the separation and zone on the side surface of a segmented body on flow outside of this zone and on the aerodynamic characteristics of the body can be modeled well by calculating the flow for an ideal gas. It is shown that with three-dimensional flow around sufficiently long segmented bodies, over flow of the stream near the surface of the body results in the formation of a suspended compression jump on the lee side of the flow. 5 Biblio. "Investigation of Supersonic Three-Dimensional Flow Around Blunt Bodies"

Nauch. tr. In-t mekh. Mosk. un-ta (Scientific Works of the Institute of Mechanics, Moscow University), 1970, No 5, pp 4-19 (from RZh-Mekhanika, No 7, Jul 71, Abstract No 7B310)

Translation: The paper generalizes the results of studies of supersonic three-dimensional flow around smooth bodies carried out in recent years at the Institute of Mechanics of Moscow State University with the use of numerical methods developed under the direction of G. F. Telenin. The flow is first analyzed on the frontal surfaces of bodies. It is noted that in the case of small angles of attack, the flow pattern in the neighborhood of the critical point for all bodies is practically indistinguishable from the flow pattern at the zero angle of attack. The gradients of velocity on the body in the plane of symmetry and perpendicular to the plane of symmetry are similar, and the geometric pattern of flow from the critical point differs little from a dicritical node. For large angles of attack in the case of a monotonic increase in the curvature of the con-

tour of the body along a generatrix, all stream lines (with the exception of those lying in the plane of symmetry) approach the critical point with a common tangent perpendicular to the plane of symmetry. The stream line with maximum entropy is located closer to the axis of symmetry of the body than the critical stream line. With an increase in the curvature of the body along the generatrix, all stream lines at the stagnation point have a common tangent lying in the plane of symmetry of the flow, and the stream line with maximum entropy lies further from the axis of symmetry of the body than the critical line. Flow around blunt bodies of low aspect ratio of the spherical sector type is then considered. A typical characteristic of flow around such bodies is the presence of a detached zone on the lee side, which cannot be realized in an ideal gas flow. With the use of pressure levels in the detached zone borrowed from experimental data, an approximate method is proposed to account for the detached region. It is shown by numerical calculations that the proposed method satisfactorily simulates real flow of a viscous gas round a body while the boundary layer on the forward surface is fairly thin. Graphs present the results of calculations for a body with a frontal surface close to a sixty-degree spherical sector with an inverted cone angle from 0° to 30° at angles of attack of up

to 30° and Mach numbers of oncoming flow $M_\infty > 5$.

Flow around high-aspect blunt bodies at angles of attack also revealed a number of singularities. It is noted in particular that even at low angles of attack there is considerable gas overflow leading to an increase in the pressure on the leeward side over the pressure on the windward generatrix beginning at a certain length. This length is practically independent of the angle of attack. In numerical calculations on the lee side the characteristics start to intersect at some distance from the blunting, which is due to the development of a compression shock.

The last part of the work gives an approximate account of the effect of the real nature of the gas in hypersonic flow around segmental bodies. It is proposed that flow around the frontal section be considered equilibrium flow with an adiabatic exponent determined from the condition of equality of the density ratio in the forward compression shock. Calculation of the supersonic region is done at an adiabatic coefficient obtained from the condition of "freezing" of the state of the gas at the midsection of the body. A comparison with the results of calculation of nonequilibrium streamline flow shows satisfactory accuracy of the proposed model. The data of numerous calculations are presented in graphs. Bibliography of 13 titles. I. N. Murzinov.

"A Resonator for Measuring the Permittivity of Sheet Specimens of Dielectrics on Superhigh Frequencies"

Moscow, Otkrytiya, Izobreteniya, Promyshelnyye Otkrytiya, Tovarnyye Znaki, No 31, Nov 71, Author's Certificate No 317994, Division G, filed 3 Jun 69, published 19 Oct 71, pp 171-172

Translation: This Author's Certificate introduces a resonator for measuring the permittivity of sheet specimens of dielectrics on superhigh frequencies. The device contains a coaxial section shorted at both ends. As a distinguishing feature of the patent, measurement accuracy is improved by making the length of the resonator close to an odd number of $\frac{1}{2}$ -waves of the working frequencies, and making a transverse slot through the middle of the resonator to accommodate the dielectric specimen to be studied.
