"High Temperature Creep of Zirconium Carbide"

Problemy Prochnosti, No 3, 1972, pp 50-53.

Abstract: Results are presented from creep and long-term strength tests of specimens of zirconium carbide in the 2,450-2,810°K temperature range. The nature of behavior of the zirconium carbide in various stages of creep and the relationship between parameters characterizing creep and the test conditions of the material are studied. It is demonstrated that in the 2,450-2,810°K temperature interval with stresses of 0.3-1.0 kg/mm<sup>2</sup>, the stable stage of creep of zirconium carbide is determined by a diffusion process with an activation energy of  $116 \pm 18$  kcal/mol.

"Evaluation of the Effect of Nonsteady-State Conditions in a Calculation for the Flutter of Aircraft With a Wing of Low Aspect Ratio in an Incompressible Flow"

Uch. zap. Tsentr. aerogidrodinam. in-ta (Scientific Notes of the Central Aerohydrodynamic Institute), 1972, Vol. 3, No. 4, pp 145-148 (from RZh-41. Raketostroyeniye, No 11, Nov 72, Abstract No 11.41.138)

Translation: Aerodynamic effects determining the "aerodynamic rigidity" of an aircraft are considered as the sum of the actions of aerodynamic forces existing at a Strouhal number equal to zero and forces proportional to the square of the Strouhal number added to the inertial forces. The dependence of aerodynamic rigidity and aerodynamic damping on the Strouhal number is considered for triangular wings under certain types of deformations and also considered as the dependence on the lengthening of the wing. The contribution made to inertial forces by increment in the aerodynamic loads proportional to the squares of the Strouhal numbers is evaluated for typical types of

"High Temperature Thermomechanical Treatment of EI 811 Stainless Steel"

Izvestiya Akademii Nauk SSSR, Metally, No 4, Jul-Aug 73, pp 129-131.

Abstract: This work studied the possibility of increasing the strength of EI 811 steel by high temperature heat and mechanical treatment. The studies were performed using a steel of the following composition: 0.13% C, 0.33% Mn, 0.37% Si, 0.023% P, 0.077% S, 5.7% Ni, 21.1% Cr, 0.43% Ti, Fe -- remainder. The material was plastically deformed by rolling at 1100-900° C, 50% compression, velocity 4.3 m/min. Specimens 20 mm in diameter and 150 mm long were heated to 1000 or 1100° C, held 30 minutes, then deformed at these temperatures with subsequent immediate quenching in water. Specimens heated to 1000° C were allowed to cool in air to 900° C, then rolled at that temperature and held 5 minutes at that temperature before quenching. It was found that the selection of the temperature mode for plastic deformation must be based on consideration of the different tendencies of the ferritic and austenitic components toward softening. The strength characteristics of this steel were increased significantly only after deformation at 900° C, which causes

"A Study of the Transformation of Microorganisms"

Moscow, Veterinariya, No 6, Jun 73, pp 46-47

Abstract: In a study conducted on five strains of *C. perfringens* (two of type V and three of type D), variants of one strain (D-213) could be selected on cultivation at gradually increasing concentrations of streptomycin in the medium that exhibited a raised resistance to this antibiotic. The streptomycin concentration at which the transformed D-213 strain (D-213 M) could be cultivated after 3-4 selections of mutants that withstood increasing concentrations of the antibiotic reached 10,000-12,000 units/ml vs. a maximum concentration of 500 units/ml and 400 units/ml for the initial D and V strains, respectively. DNA isolated from the modified strain D-213 M was found to transform the initial, unmodified strain D-213 into one with a heightened resistance to streptomycin. The work was conducted under the direction of Prof. M. D. Polykovskiy.

ABSTRACT. AN APPARATUS IS DESCRIBED, WHICH OPERATES AS A SELECTIVE NARROW BAND TUNABLE DETECTOR OF INFRARED RADIATION IN THE 25-300 MICROMETER RANGE AND ALSO, AS A WIDE BAND "ELECTRON BOLOMETER" IN THE 300-2000 MICROMETER RANGE. IT CONSISTS OF THREE BLOC UNITS: 1) THE HELLIUM CRYOSTAT WITH A LIGHT GUIDE, A SUPERCONDUCTING SOLENOID, AND A PHOTSENSITIVE ELEMENT; 2) A STAND FOR ELECTRON INSTRUMENTS; AND 3) A MODULATOR. ITS SENSITIVITY IS RELATIVELY INDEPENDENT OF THE WAVE LENGTH FROM SEVERAL MILLIMETERS DOWN TO 600 MICROMETERS. THE SENSITIVITY SPECTRAL CHARACTERISTICS OF THE APPARATUS AT A MAGNETIC FIELD VALUE OF SIMILAR TO 22.5 KOE (AS RECORDED BY A VACUUM MONOCHROMATOR WITH CHANGEABLE ECHELETTE GRATINGS WHICH OPERATES IN THE 20-2000 MICROMETER RANGE) IS PRESENTED. IT HAS A DEFINITE RESONANCE FORM WITH A RELATIVE 5 PERCENT HALF WIDTH. IT IS CONCLUDED THE DESCRIBED RECEIVER IS HIGHLY SENSITIVE AND HAS A SMALL INERTIA. IN THE 25-300 MICROMETER RANGE THE APPARATUS HAS NARROW BAND SENSITIVITY WITH A POSSIBILITY OF TUNING THE ENTIRE WAVE RANGE BY A SIMPLE VARIATION OF CURRENT, AND CONSEQUENTLY MAGNETIC FIELD, IN A SUPERCONDUCTING SOLENOID. WHEN SWITCHING IT ON A WEAK MAGNETIC FIELD (H SMALLER THAN OR EQUAL TO 5 KOE) OR CUTTING OFF THE SOLENOID, IT OPERATES AS A NONSELECTIVE DETECTOR SENSITIVE TO RADIATION WITH LAMBDA LARGER THAN OR EQUAL TO 300 UM WAVE LENGTH. A COMPARATIVELY SMALL RESISTANCE OF THE RECEIVER ELEMENT (5-10 KOHM) MAKES IT POSSIBLE TO OBTAIN A SMALL TIME CONSTANT, WHICH DETERMINES THE SPEED OF PHYSICAL PROCESSES IN A CRYSTAL.

"Tunable Receiver of Long Wave Infrared Radiation"

Moscow, Radiotekhnika i Elektronika, Vol 15, No 2, 1970, pp 371-375

Abstract: An apparatus is described, which operates as a selective narrow band tunable detector of infrared radiation in the 25-300 micrometer range and also, as a wide band "electron-bolometer" in the 300-2000 micrometer range. It consists of three bloc units: 1) the helium cryostat with a light guide, a superconducting solenoid, and a photosensitive element; 2) a stand for electron instruments; and 3) a modulator.

Its sensitivity is relatively independent of the wave length from several millimeters down to 600 micrometers. The sensitivity spectral characteristic of the apparatus at a magnetic field value of  $\sim 22.5$  koe (as recorded by a vacuum monochromator with changeable echelatte gratings which operates in the 20-2000 micrometer range) is presented. It has a definite resonance form with a relative 5 percent half-width. It is concluded the the described receiver is highly sensitive and has a small inertia.

1/2

USSR

NAD', F. Ya., et al., Radiotekhnika i Elektronika, Vol 15, No 2, 1970, pp 371-375

In the 25-300 micrometer range the apparatus has narrow-band sensitivity with a possibility of tuning the entire wave range by a simple variation of current, and consequently magnetic field, in a superconducting solenoid. When switching it on a weak magnetic field ( $H \leq 5$  koe) or cutting-off the solenoid, it operates as a nonselective detector sensitive to radiation with  $\lambda \geq 300 \mu m$  wave length. A comparatively small resistance of the receiver element (5-10 kohm) makes it possible to obtain a small time constant, which determines the speed of physical processes in a crystal. Orig. art has: 3 figures.

"Changes in the Phase Structure of the Cardiac Cycle During Continuous Whole-  
-Body Irradiation of Rabbits"

Tbilisi, Soobshcheniya Akademii Nauk Gruzinskoy SSR, No 1, 1973, pp 193-195

Abstract: The first signs of approaching radiation shock appeared in rabbits within 30 to 35 minutes of continuous whole-body irradiation at 10 to 16 krad, although blood pressure remained fairly high. The period of contraction increased while the duration of ejection decreased. Blumberger's mechanical coefficient also decreased and Hegglin's interval became sharply negative. Thus, despite the fact that blood pressure, pulse, and respiratory rate at this time had not changed significantly, there were clear indications of the phase syndrome of hypodynamia of the left ventricle. After exposure to doses ranging from 18 to 25 krad, the animals' blood pressure began to fall quickly, the pulse and respiration slowed, and the symptoms characteristic of radiation shock appeared. The animals died within 20 to 30 minutes in a state of deep shock. The phase structure of the cardiac cycle was severely disrupted.

"Processing Medical Information With the "Minsk-22M" Computer and "Blank-P"  
Automatic Counting System"

Minsk, Zdravookhraneniye Belorussii, No 6, 1970, pp 62-66

Abstract: Machine storage of medical information and the use of a ready retrieval system were discussed. In addition, a form No 266-M, divided into 60 zones and 490 cells, capable of deciphering 999 pertinent medical problems was added. After detailed presentation of the workings of the "Minsk-22M" computer in conjunction with these blanks, it was concluded that: Machine processing of medical information with the aid of formal documents improves the quality of book-keeping, insures veracity of the data, improves accountability by compiling additional summaries and indicators, and standardizes the discrepancies in diagnoses and therapeutic processes for all medical personnel. In addition, computer processing improves the organization of the initial documentation, perfects the organization of work for accounting personnel and other institutional personnel by freeing them from search and grouping operations, substantially increases the productivity of statisticians, and increases the quality and efficiency of management of a medical establishment.

"Current Pulse Shaper"

USSR Author's Certificate No. 275119, Filed 31/03/69, Published 15/10/70 (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No. 4, 1971, Abstract No. 4B298P).

Translation: The pulse shaper suggested is designed for operation in magnetic memories and can be used in the address or storage portion of the memory. Current pulse shapers containing diode-transformer tubes and transistor switches are well known. The device suggested differs from known devices in that the collector of the transistor is connected through a series-connected secondary transformer winding, diode, and resistor to the emitter of an emitter repeater. This increases the reliability of the device. 1 fig.

"The Effect of Effluents From a Hard Alloy Plant on the Groundwater"

Moscow, Gigiyena i Sanitariya, No 4, 1970, pp 106-107

Abstract: The discharge of untreated effluents from an unspecified hard alloy plant into a lake resulted in pollution of the groundwater in the vicinity, both through direct percolation of water from the lake, and through the washing out by rain of salts from the soils adjacent to the lake. Analysis of well water at several points located 3-7 km from the lake revealed the presence of tungsten in all the water-supply sources. Concentrations were highest in the wells of inhabited localities closest to the lake. The amount of the element in many wells was somewhat greater during the flood season than in the low-water period. The tungsten content was 2-5 times above the permissible concentration in well water (0.1 mg/liter). Tungsten was also present in concentrations of 0.02-0.06 mg/liter in bodies of open water free from industrial effluents.

"On the Problem of the Effect Which a Sudden Change in the Roughness of the Underlying Surface Has on Turbulent Boundary Layer Conditions"

Tr. Gl. geofiz. observ. (Works of the Main Geophysical Observatory), 1970, vyp. 257, pp 109-116 (from RZh-Mekhanika, No 4, Apr 71, Abstract No 4B889)

Translation: The paper presents the results of a numerical experiment on calculating the flow conditions in a turbulent boundary layer deformed under the effect of an abrupt change in the roughness of the underlying surface. In contrast to previous theoretical studies of the problem, the coefficient of turbulence is included among the internal parameters of the scheme, and is sought during the process of solution along with the other flow characteristics. Profiles of the average wind speed, kinetic energy of turbulence and friction stress at the surface are calculated and presented. Some results of the calculations are compared with full-scale experimental data. Bibliography of 14 titles. Author's abstract.

"Heat Effects in Unevacuated Ponderomotive Laser Emission Meters"

Radiotekhnika. Resp. mezhved. temat. nauch.-tekhn. sb. (Radio Engineering. Republic Interdepartmental Thematic Scientific and Technical Collection), 1973, vyp. 25, pp 14-17 (from RZh-Fizika, No 8, Aug 73, abstract No 8D1142 by the authors)

Translation: The thermal effects caused by convection of the air contained in a ponderomotive meter are considered. The effects which contribute most to the error in measuring the mechanical action of emission are singled out and investigated. Heat effects are studied over a broad dynamic range and as a function of the angle between the receiving element and the vertical, the location of the receiving element between the input windows, and the volume of the reception chamber of the meter.

EXPERIMENTAL STUDY OF AN AC CONDUCTION PUMP USING A LIQUID-METAL SODIUM LOOP  
 (Abstract of a paper by N. A. Bliznykh, Ye. V. Sizyada, F. N. Zhdankin, and  
 others at the Magneto-hydrodynamic Conference, p 143)

An experimental study was made of a laboratory model of a single-phase  
 ac conduction pump with the following parameters:

Rated field  $p_m = 0.4 \cdot 10^5 \text{ n/m}^2$   
 Rated output capacity  $Q_n = 3 \cdot 10^{-3} \text{ m}^3/sec$   
 Metal - liquid sodium for  $t^0 = 460^\circ C$   
 Dimensions of the channel core  $10 \times 50 \times 60 \text{ mm}^3$

The experiment was performed on a liquid-metal Pu-40 circuit of the  
 Physics Institute of the Latvian SSR Academy of Sciences.

The external characteristics  $p = p(Q)$ , the volt-ampere characteristics  
 $U = U(I)$  under the condition of  $p/Q^2 = const$  and the characteristics  $n = n(Q)$   
 were determined. A study was also made of the distribution of the electric and  
 magnetic fields.

The basic experimental results are depicted in Figures 1 and 2.

MADEZHITSKIY, I. P., Gusev Glass-Fiber Plant

"Automation and Mechanization of Glass-Fiber Production"

Moscow, Steklo i Keramika, No 1, Jan 72, pp 31-32

Abstract: Various innovations and new mechanisms have enabled the Gusev Glass-Fiber Plant to advance output during the Eighth Five-Year Plan. Transport of raw glass to the electric furnaces is now mechanized, as is transport of lubricant to the glass-spinning section; the RTS-5 electronic temperature regulator is used in the smeltery. All basic processing and transport has been at least partly mechanized, in order to free specialized workers (furnace operators, shapers, etc.). New mechanisms and procedures have been worked out by the All-Union Scientific Research Institute of Glass Plastics and Glass Fiber, in collaboration with plant employees.

The machine shop of the Gusev plant now turns out more than 40,000 plastic parts a year, thus saving several tons of ferrous and other metals.

"Whisker Crystals of Ammonium Perchlorate. Their Mechanical Properties"

Moscow, Doklady Akademii Nauk SSSR, Vol 209, No 1, 1973, pp 157-159

Abstract: In earlier work by Rayevskiy, Manelis, etal (DAN SSSR, 151, No 4, 886, 1963; 160, No 5, 1136, 1965) the assumption was made that dislocations play a significant role in the thermal decomposition of orthorhombic crystals of  $\text{NH}_4\text{ClO}_4$ . In the present work, whisker crystals of  $\text{NH}_4\text{ClO}_4$  were grown by utilizing the capacity of moist  $\text{NH}_4\text{ClO}_4$  to creep during crystallization. Into a layer of moist crystals of  $\text{NH}_4\text{ClO}_4$  placed in a beaker the open end of a glass cylinder closed on top was inserted. On the outer surface of the cylinder lengthwise rough strips with a width of 5 mm were ground to facilitate creeping. Outside of the beaker an open glass cylinder was placed to produce a humidity gradient. The arrangement was kept for several days at room temperature in a chamber with a constant humidity. Whisker crystals grew on the outer surface of the closed cylinder. The whiskers had a circular cross section, a tubular

1/2

USSR

RAYEVSKIY, A. V., et al., Doklady Akademii Nauk SSSR, Vol 209, No 1, 1973, pp 157-159

shape, a wall thickness of 1.5-10  $\mu$ , and an outer radius up to several tens of microns. The length of the whiskers was  $\approx$  50  $\mu$ m. The whisker crystals had a tensile strength up to a level above 13 kg/mm<sup>2</sup> vs.  $\approx$  0.5 kg/mm<sup>2</sup> for ordinary NH<sub>4</sub>ClO<sub>4</sub> crystals and a higher elastic deformation up to the fracture point

( $\approx$  0.2-1%) than that of the latter. The tensile strength decreased with an increasing wall thickness, but did not depend on the outer radius. X-Ray diffraction measurements carried out by Yu. A. Sokolov showed that the whiskers grew in the direction of the z axis. Whisker crystals with similar properties were grown from NH<sub>4</sub>ClO<sub>4</sub> containing  $\approx$  1 mole % K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>. The mechanical properties of the whisker crystals indicated that they were practically free of dislocations. (Submitted by Academician N. N. Semenov, 31 Jul 72).

"The Effect of Light on Dislocation Mobility in Gamma-Irradiated Alkali Halide Crystals"

Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya (News of the Academy of Sciences USSR, Physics Series), Vol 35, No 7, 1971, pp 1422-1424

Abstract: The subsonic mobility of dislocations in alkali halide crystals is highly sensitive to crystal structure and highly dependent on the state and distribution of point defects. Study of mobility processes thus yields information on the states and the distribution of defects after irradiation and explains certain light and heat-induced changes related to the centers.

The effect of light on the rate of individual screw dislocations is studied in gamma-irradiated KCl and NaCl crystals. The effect of light on the motion of dislocations is called dislocation of photomobility. The ratio of dark mobility to light mobility for both crystals depends exponentially on shear stress (the ratio decreases as stress increases).  
1/2

USSR

YERMAKOV, G. A. et al, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol 35, No 7, 1971, pp 1422-1424

The effect is observed only in colored crystals and depends on temperature and the intensity and spectral composition of the incident light, reaching maximum under monochromatic light in the F-band. Irradiation seems to change the F-centers into stronger retarding centers in the immediate vicinity of dislocations. The authors speculate on the nature of these centers.

Orig. art. has 2 figs. and 7 refs.

YERMANOV, G. A.; MADGORNYY, E. M. (Institute of the Physics of Solids of the USSR Academy of Sciences, Chernogolovka)

"Dislocation Mobility in Gamma-Irradiated Crystals of Sodium Chloride. High-Rate Region"

Leningrad, Fizika Tverdogo Tela; February, 1971; pp 513-9

ABSTRACT: A study was made of the dependence of the rate of screw dislocation on the shear stress  $\tau$  and the temperature in the interval  $T = 77^{\circ}-300^{\circ}\text{K}$  in the high-rate region  $v > 10^3$  cm/sec in gamma-irradiated crystals of sodium chloride, for which  $v(\tau)$  was studied earlier in the low-rate region. It was shown that movement in high- and low-rate regions is substantially different in alkali-haloid crystals (different forms of  $v(\tau)$ , different with respect to the sign of the function  $v(\tau)$ , a different character of the effect of the radiation point defects). The conclusion is drawn that the movement of the

1/2

USSR

YERMAKOV, G. A., et al., Fizika Tverdogo Tela, Feb 71, pp 513-519

dislocations for  $v > 10^3$  cm/sec in these crystals is quasi-viscous. The value of the effective viscosity  $B$  depends on the radiation dose and the temperature ( $B = 0.15-0.50$  millipièze [1 pièze is equal to a pressure of 1 cN on an area of  $1 \text{ m}^2$ ]). The temperature function  $B(T)$  indicates a possible role of phonon processes in dislocation retardation in the range of rates studied. The occurrence of a delay in the movement of dislocations having a thermoactivation character and connected with the diffusion strengthening of dislocations in this range of  $v$ ,  $t$ , and  $T$  was investigated.

ON THE THEORY OF SUPERPLASTICITY

UDC 539.214

K. P. Garov, M. Kh. Shorshorov, A. S. Tikhonov, and N. I. Nadirashvili,  
Institute of Metallurgy, imeni A. A. Baykov of the USSR Academy of  
Sciences, submitted to press 5 January 1972. Paper 11-45-1142

A theoretical model is proposed in which the optimum conditions of superplasticity are connected with the maximum developed interphase surface of the fluctuation nuclei of the new phase. An estimate of the distribution of these nuclei according to dimensions, as a function of temperature, is performed from the standpoint of the theory of pre-translational phenomena of Ya. I. Frenkel'. A comparison of the calculation data with the experimental results for a number of systems demonstrated the validity of such a model.

At the present time we may consider the concept that in the phenomenon of superplasticity of metallic materials the surface effects play the determining role (the effects at the inter-phase and inter-strain boundaries) may be considered as generally accepted. In connection with this, the use of the idea of Ya. I. Frenkel' [1] for estimation of the optimum conditions of superplasticity appears feasible.

The fact that the temperature corresponding to the optimum conditions of superplasticity lies close (but is not equal!) to the temperature of the phase transition (the polymorphic transformation or melting) calls attention to itself. According to the considerations of Ya. I. Frenkel', the given temperature region should be considered as a "pre-transition" state of a system having its own specific features, caused by the presence of fluctuation nuclei of the new phase in the aggregate at the temperatures indicated. These nuclei appear all the time and disappear, or change their dimensions, but there is a dynamic equilibrium between them, that is, in the given case, we may speak of an entirely stable distribution of the nuclei according to

dimensions (at a constant temperature). According to Frenkel's, this distribution is characterized by the ratio

$$n_i = N \exp\left\{-\frac{W_i}{kT}\right\} \quad (1)$$

Here  $n_i$  is the number of nuclei containing  $i$  atoms;  $N$  is a standardizing multiplier,  $k$  is the Boltzmann constant;  $\Delta F_i$  is the variation of the thermodynamic potential of the system in the formation of a nucleus of the new phase in it. We may assume that  $\Delta F_i$  consists of two items, considering the volumetric thermal effect of the transition and appearance of surface tension in the nuclei of the new phase. Generally speaking, there is still a third item, connected with the appearance of the microstress because of local deformation (strain) in the vicinity of the nucleus. However, we ignore this effect; we will speak further of the permissibility of ignoring the effect at the end of the article.

According to Frenkel's, for an estimate of  $\Delta F_i$  we may use the formula

$$\Delta F_i = Q \frac{(T - T_0)}{T_0} + \beta \sigma_i \quad (2)$$

where  $Q$  is the latent heat of the transition (referred to one atom) at the true temperature  $T_0$  of the phase transition ( $Q < 0$  at  $T < T_0$ ), and  $\beta \sigma_i$  is the variation of  $\Delta F_i$  because of the appearance of surface tension ( $\beta < 0$ ).

Thus, according to this model, in the region of a pre-transition state at the approximation of the temperature to the true temperature of transition, both the number of nuclei and their distribution with respect to dimensions varies, and, consequently, the total area of the inter-phase boundaries varies. In this case, far from the temperature  $T_0$  the number of nuclei and the total area of their surfaces are negligible, but as  $T$  approaches  $T_0$  the total area increases. At  $T = T_0$  all the nuclei join into one common phase and the area of the internal inter-phase surfaces tend toward zero. Therefore, the total area of the surfaces of the nuclei as a function of the temperature must pass through an extreme (a maximum).

We assume that between the temperature corresponding to such an extreme and the optimum temperature of superplasticity there must be a definite correlation. In this work an attempt is made to establish such a correlation by means of approximate estimation of the temperature corresponding to the maximum total area of the surfaces of the nuclei. We must emphasize that if we succeed in confirming the presence of such a

"Effect of Lyophilization on the Diagnostic Properties of Pseudomonas Bacteria"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 6, Nov/Dec 70, pp 903-906

Abstract: After lyophilization, *Pseudomonas aurantiaca*, *fluorescens*, and *pyocyanea* cultures kept for 12-18 months at temperatures of 2-4°C were found to be largely unchanged in their diagnostic properties. Microscopic studies showed that the bacteria retained their bacilliary shape and their size (1 to 1.5 x 0.5 ). The Hugh-Leifson method was used to study the consumption of carbon from various sources, including glucose, mannose, galactose, lactose, sucrose, maltose, d-arabinose, 1-arabinose, xylose, glycerin, salicyl, inositol, and mannite. In some cases, there was a delay of 48-60 hours in the conversion of some of these carbon sources; after one or two exchanges of the nutrient medium, however, the test cultures exhibited the same behavior in this respect as the controls. Urease formation, the use of organic acids as carbon sources, and the Lysenko iodine-acetate test were also studied. No changes in the diagnostic properties of the bacteria were found in any test.

"Type O Electron Microwave Device"

USSR Author's Certificate No 270097, filed 13 Nov 67, published 30 July 70 (from  
RZh--Elektronika i yeye primeneniye, No 2, February 1971, Abstract No 2A195P)

Translation: A Type O electron microwave device with magnetic focusing of the electron stream is proposed, which contains an ion trap between the electron gun and the decelerating system. With the object of the elimination of ordinary and noise parasitic oscillations in the signal spectrum, the ion trap with a periodic electrostatic field is made in the form of a packet of conducting plates divided by insulators with apertures in the center for passage of the electron stream.

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obrazttsy, Tovarnyye Znaki, No 16, 8 May 70, p 56, Patent No 270097, Filed 13 Nov 67

Translation: This Author's Certificate introduces a superhigh-frequency type "O" electron device with magnetic focusing of the electron flux. This device contains an ion trap between the electron gun and the decelerating system. The device is distinguished by the fact that in order to eliminate regular and noise parasitic oscillations in the signal spectrum, the ion trap with a periodic electrostatic field is executed in the form of a bunch of conducting plates separated by insulators with holes in the center for passage of the electron flux.

"The Influence of Defoliants on Two Phases of the Formation Process of the Exfoliating Layer in Cultures of Cotton Plant Seed Leaves"

Moscow, Agrokhimiya, No 2, 1973, pp 128-133

Abstract: Experiments were conducted on seed leaf cultures of *Gossipium hirsutum* L, type 108-F, prepared from sprouts which had two true leaves. The explanted leaves measured 12 mm, and they were exposed to the defoliants by placing the stem ends in a 1% agar solution containing the test substance, in Petri dishes. Tests were made using butyphos, magnesium chlorate, and ethrel. The length of the first phase was determined to be from the time of preparation until the explanted leaves' loss of sensitivity to indolyl-acetic acid. For this reason the leaves were placed in an agar solution containing indolyacetic acid at intervals and observation was made for the cessation of the acid's inhibiting action in formation of the separating layer. The tests were repeated four times, in light, with a temperature of 25-30 C. Results indicated that butyphos and magnesium chlorate speeded the second phase of formation but did not seem to effect the first phase

1/2

ZUBKOVA, N. F., et al., *Agrckhimiya*, No 2, 1973, pp 128-133

of separating layer formation. In the constant presence of indolylacetic acid both phases were speeded by these defoliant. Ethrel speeded both phases of separation and proved to be the most active of the three tested defoliant.

Tr. 2-go Vses. soveshch. po issled. ostatkov pestitsidov i profilakt. zagryazneniya imi produktov pitaniya, kormov i vnesh. sredy (Works of the Second All-Union Conference on Investigation of Residues of Pesticides, and Prevention of Pesticide Contamination of Foodstuffs, Fodder and the External Environment), Tallinn, 1971, pp 1790180 (From RZh-Khimiya, No 11, Jun 72, Abstract No 11N459)

Translation: The study material is pulverized, triturated with quartz sand, the homogenate is washed with acetone, filtered, 0.3 ml of concentrated  $HNO_3$  is added to the acetone extract, the mixture is evaporated, and the residue is dissolved in ethanol and chromatographically analysed on silica gel in a fixed layer in the hexane-acetone system (5:1), and developed with a bromophenol reagent. The sensitivity of the method is 0.5-1  $\mu$ . Within a half hour after applying butyphos to the leaf blade, the compound is detected in the petiole and in the zone of attachment of the leaf. The leaf blade tissue interacts with the butyphos and the content of the chemical decreases.

DUBOVY, E. I. and NADTOCHY, V. G."On the Fine Structure of Gigantic Resonance in  $^{58}\text{Ni}$ "

Moscow, Izvestiya Akademii Nauk SSSR -- Seriya Fizicheskaya, Vol XXXV, No 8, 1971, pp 1742-1743

Abstract: The fine resonance structure of a photoneutron cross section in a  $^{58}\text{Ni}$  nucleus is analyzed in the present article by means of the technique of Feynman diagrams. The article contains a drawing of the type of triangular diagrams used. The diagrams illustrate three virtual processes: the disintegration of  $^{58}\text{Ni} \rightarrow ^{57}\text{Ni} + n$ , excitation of the  $^{57}\text{Ni}$  nucleus by a photon, and inelastic scattering of the neutron in  $^{57}\text{Ni}$  along with transfer of excitation to the neutron. These diagrams specify the existence of extrema in the cross section, the positions of which coincide with the thresholds of the  $(\gamma n)$ -reactions in  $^{58}\text{Ni}$  with excitation of the residual nucleus of  $^{57}\text{Ni}$ . Within the limits of experimental error, 200 kilo electron volts, all resonances except for 18.6 million electron volts were found to coincide in position with the extrema. However, the resonance structure of the cross section cannot be unequivocally identified with these extrema because resonances could also be caused by the interaction in a finite state of a  $^{57}\text{Ni}$  nucleus and a neutron rather than a photon.

"Phase Direction Finder with Successive Signal Comparison"

Kiev, Izvestiya vysshikh uchebnykh zavedeniy--Radioelektronika, Vol XIV, No 8, 1971, pp 889-893

Abstract: A study was made of the possibility of using an autocorrelation receiver in a phase direction finder with successive signal comparison, and the instrument error was analyzed. The information about the spatial position of a target is to be found in the amplitude and the phase difference. Only the phase difference of the signals is considered here. The computed signal resembles a signal with relative phase manipulation, and autocorrelation receivers are used to process the signals [Petrovich, Peredacha diskpetyay informatsii v kanalakh s fazovoy manipulyatsiyey, Soviet Radio Press, 1965]. A block diagram of a range finder using an autocorrelation device is presented, and its operation is described.

The presented direction finder can operate not only with respect to monoharmonic signals but also with respect to continuous narrow band AM and FM

of the medical corps A.Y. Medvedev, Lieutenant Colonel

The patient S., a 51-year-old woman, fell suddenly in  
the park up a flight of stairs in the right side of her abdomen  
during a walk. Examination revealed a limited  
activity painful on palpation. The surgeon diagnosed a limited  
contraction of the intestine. However, the patient  
patient grew increasingly worse, despite treatment  
over the whole first day of her stay in the hospital. The  
pains became more and more severe, as well as nausea.  
On arrival, her condition was found to be serious, she  
nausea pains in the right side of the abdomen, she complained of  
her back, and the slightest movement aggravated the pain. The  
of the face and the visible movement aggravated the pain. The  
symptoms of the liver. The pulse was 165 per minute and weak. Blood  
pressure was 95/52 mm. Hg. The abdomen was distended especially on  
the right side. The liver, spleen and the right kidney cannot be  
palpated because of the tension of the muscles of the abdominal wall.  
A partial intestinal obstruction is clearly pronounced on the right side.  
of the region and absence of any local pain. The blood test gave the  
following results: hemoglobin 67 percent, erythrocytes 3,350,000,  
leucocytes 13,000, erythrocyte sedimentation rate 15 mm. per hour.

Diagnosis of the patient's increasingly worsening condition  
and then under ether-oxycodone narcosis, following a partial laparotomy,  
to the right, there was found a tumor of the sigmoid colon, measuring  
approximately 25 x 17 cm, and lying up almost the entire right side of  
the abdominal wall. Extensive herniation of a dark-red, very  
emitted, hard of the sigmoid of the colon was found on opening the  
lump the peritoneal cavity. The peritoneum was torn, and a blood  
and the 100 cm. of hemorrhagic exudate was removed. The organs of  
the abdominal cavity were examined and removed. The organs of  
were introduced into the abdominal cavity and a catheter-ally-ally-ally  
found was introduced into the abdominal cavity and the muscles, and the  
localy tamponade. Postoperative progress was uneventful. The  
patient was released from the hospital on the 23rd day.

Received in February 1969.

"Sanitary Hydraulic Engineering and Its Role in Preventing Certain Diseases and Controlling Blood-Sucking Insects in Azerbaydzhah"

Baku, Azerbaydzhanskiy Meditsinskiy Zhurnal, No 3, 1970, pp 72-76

Abstract: During field trips in 1967-1968 to different parts of Azerbaydzhah, the authors found large bodies of water resulting from the failure to observe sanitary regulations in the building, repair, and operation of hydraulic works and from irrigation systems and reclamation projects. These new expanses of water are epidemiological factors in the spread of malaria, leptospirosis, tularemia and other water-borne infections. They also create favorable conditions for helminthiases, tickborne spirochetosis, and other diseases. Epidemic-control measures must be instituted at all the projects involving water. The costs of prevention are far less than the economic losses produced by outbreaks of the diseases mentioned above.

"Photon Emission in Hadron Pair Production in Colliding Electron-Positron Beams"

Moscow, Yadernaya Fizika, Vol 14, No 3, 1971, pp 655-660

Abstract: The annihilation of an arbitrarily polarized  $e^-e^+$ -pair in a pair of hadrons accompanied by polarized photon emission is studied. Plots corresponding to photon emission by initial leptons are considered. Even though photon emission by the created hadrons can make some contribution to the cross-section for a certain region of kinematic variables, the principal contribution is that of photon emission by light initial particles. The coefficient of asymmetry, defined as the ratio of the difference of cross-sections to their sum for parallel ( $\gamma\gamma' = 1$ ) and antiparallel ( $\gamma\gamma' = -1$ ) transverse spins of electron and positron, was derived. The degree of circular polarization of gamma-quanta was also presented.

"Multiphoton Polarized Bremsstrahlung"

Moscow, Journal of Nuclear Physics, February 1970, pp 415-424

Abstract: The differential cross sections of two-, three-, and four-photon bremsstrahlung of an electron in the field of a nucleus, for any energies but small particle scattering angles, is calculated, taking into account longitudinal polarization of electrons and circular polarization of photons. Certain principles in multiphoton bremsstrahlung are also established. Particle scattering angles can deviate from 0 and  $\pi$  by several degrees. In particular, it is shown that an even number of hard bremsstrahlung photons will radiate mainly at small angles.

"Effect of Tetramethylthiuram Disulfide (TMTD) on the Action of Some Drugs"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 11, 1972, pp 8-11

Abstract: TMTD, a pesticide used to treat cotton seeds, grains, etc., was found to potentiate the effect of the hypnotic hexobarbital and that of the convulsant pentylenetetrazol in rats. TMTD injected intraperitoneally at doses ranging from 1/20 to 13 LD<sub>50</sub> after the administration of hexobarbital increased the duration of the animals' sleep by 65%. At the larger dose the effect persisted 5 days. At doses of 150 and 120 LD<sub>50</sub> TMTD injected intraperitoneally into rats given pentylenetetrazol intensified the convulsions by 25 and 75%, respectively. Prolonged injection of low doses of the pesticide had a wavelike effect, the peak occurring after the first month. Both hexobarbital and pentylenetetrazol are known to be metabolized in the liver. The intensification of their effects under the influence of TMTD is attributed to the inhibitory action of the pesticide on microsomal metabolism in the liver.

PRELIMINARY RESULTS OF MEASURING THE H<sub>2</sub>O CONTENT IN THE ATMOSPHERE  
OF MARS ON THE MARS-3 AUTOMATIC SPACE STATION

[Article\* by V.I. ZORGE, A.E. NADZHIP, A.B. GIL'VART, F.A. TERENT'EV, G.  
~~XX~~  
1973, pp 797-800]

The IV-2 instrument designed to measure the water vapor content in the atmosphere of the planet was installed on the Mars-2 and Mars-3 automatic space stations (artificial Mars satellites). Such measurements have the following important advantages by comparison with ground observations [1-7]: 1) the measurements are taken with close spacing (1000-1500 km in the pericenter of the orbit) and the spatial resolution is about 5-10 km, two orders better than from the Earth; 2) all the difficulties connected with radiative absorption are completely removed, and smaller amounts of H<sub>2</sub>O can be measured than from the Earth.

The IV-2 instrument (Fig. 1) measures the H<sub>2</sub>O content in the atmosphere of Mars by the magnitude of the absorption at the center of the 1.38 μ band. The H<sub>2</sub>O band of λ = 1.38 μ is formed in the spectrum of the reflected solar radiation, and its equivalent width does not in practice depend on the vertical temperature distribution in the atmosphere of the planet. This is the theoretical difference of the IV-2 from the IR device used for the same purpose on the American Mars-9 station [8]. The IR device records the rotational band of H<sub>2</sub>O in the 25-50 μ region the intensity of which depends so strongly on the vertical temperature distribution that the band can be observed also in absorption and in emission [9].

Since the expected equivalent width of even the strongest lines at the center of the 1.38 μ band in the spectrum of Mars is small, the modulation method is used to measure it. The interference-polarization filter comprising a plate of Iceland spar (a double refracting crystal 3) and two polaroids (4, 6) and the interference filter 3 separate three lines in the center of the band: 13,768, 13,807 and 13,827 Å. On rotation of the second polaroid 6 the transmission peaks of the interference-polarization filter

"Extraction Processes in the Nickel Industry"

Moscow, Tsvetnyye Metally, No 1, Jan 74, pp 14-21

Abstract: A review is presented of Soviet and Western research and experimental-industrial work on Ni extraction processes on their industrial adoption. Tabulated data of manufactured extractants show that the Soviet assortment is poorer than that of Western firms. The principal technologies of plants applying Cu extraction by  $\alpha$ -oxyoximes (LIX-64N) in combination with electrolysis are presented, and Western firms using this method are listed. Another method, used by the Hydrometallurgical Plant of the Falconbridge firm, is discussed. Canadian, US (Inco, Pyrites), and Swedish (Goteborg University) developments are considered. The adoption of extraction in the USSR is considered expedient in the construction of new plants. Technologies for the production of electrolytic Co with use of metal extraction by  $C_7$ - $C_9$  fatty acids (Noril'sk Metallurgical-Mining Combine) and by trioctylammonium and the schemata of refining sulfate-chloride nickel electrolyte, of Zn extraction, 1/2

pp 14-21

and of Cu extraction are discussed. The problem of developing selective extractants for Ni extraction from Co solutions and for Co extraction from solutions of Ni sulfate is emphasized. Seven figures, one table, 21 bibliographic references.

Medical Service - 107  
Sgt. Viktoriy G. ...  
MS 1918

Lieutenant-Colonel of the Medical Service, 2nd ... and  
Lieut. - Colonel of the Medical Service, ...  
use of contrast hysteroangiography.

In a contrast medium in hysteroangiography, we use a mixture of  
iodolipon (2 gr.) and iodine oil (2 gr.) and powdered naphthyl-  
propanolol (2 gr.). The mucous membrane is first anesthetized and a  
test puncture is made in the sinus. If any pathological secretion is  
present, it is drawn out. The contrast medium is then injected by means  
of a Kuliyevskiy model, with a puncture of the median wall of the  
sinus at the level of the lower nasal passage. The pictures are made  
in the two nasal projections, with the patient lying down. For an  
instant check of upper mediastinal sinuses, we use the oblique projection  
recommended by S. I. Akhmetov and ... Subject. Evaluation of the  
results of contrast hysteroangiography is carried out in taking account  
of the clinical data.

A total of 69 persons were examined by this method -- 61 of them  
in the unit hospitalized and 8 in the outpatients clinic. In six cases,  
because of technical flaws, the pictures proved unsatisfactory. A  
thickening of the mucous tissue covering the sinuses, due to inflammation,  
was found in 17 cases. A phlegmon-polyip process was recorded in 17 other  
cases, cystic formations -- in 11, chronic poly-sinuitis -- in 12, and  
the remaining 10 cases showed no changes in the nasal sinuses.

The X-ray data were confirmed in subsequent surgery. The  
contrast substance we are using enables us to be sparing in the use of  
iodolipon, a substance which possesses adequate contrast under X-ray  
exposure and easily covers the walls and contents of the sinuses, and  
permits the use of more naphthyl - propanolol (for some other substances) which  
increases the viscosity of the oily mixture and strengthens its  
therapeutic effect.

Captain of the Medical Service V. A. Gellinov, Commission between pathology of the spinal cord radiculitis in the lumbosacral region and anomalies in the spine.

Out of 72 patients suffering from lumbosacral radiculitis, 25 were found to have anomalies of the lumbosacral region of the spine. In 19 of these 25 cases no found evidence of spinal radiculitis causing a single neuron, in 3 cases - several neurons were involved, in 2 - there was a combination of radiculitis and myelitis, and in one other case - there was myelitis.

In 15 of the patients the disease was due to exposure to overly cold temperatures, in 5 cases it was due to lifting excessive weights, in five other cases the cause could not be determined.

The clinical progress of lumbosacral radiculitis in the presence of anomalies in the corresponding myelogram, was characterized by the following manifestations: sudden beginning of the disease, acute deterioration of the attack; later, continuous pain in the lumbosacral area - more pronounced in the mornings, on getting out of bed, or after a long period of sitting down and declining after physical exertion; paroxysmal exacerbation caused by too low a temperature or the lifting of heavy loads; localized pain on palpation of the intervertebral spaces at the point of the anomaly.

In our opinion, anomalies of the lumbosacral sector of the spine should not be regarded as the basic cause of lumbosacral radiculitis. They may act as a contributing factor in the case of trauma of the radicles resulting from excessive strain, lifting excessive loads, or being exposed to excessively cold temperatures.

"Some Limit Theorems for a General Stochastic Model of Epidemics"

Mat. Zametki [Mathematical Essays], 1973, 13, No 5, pp 709-716 (Translated from Referativnyy Zhurnal Kibernetika, No 9, 1973, Abstract No 9V292)

Translation: The limiting distributions of the number of patients  $v_n^{(m)}$  at the moment of completion of an epidemic are studied. It is assumed that the initial number of susceptible persons  $n \rightarrow \infty$ , the initial number of patients  $m$  is limited and the ratio  $\mu/\lambda n$  approaches a constant, where the parameters  $\mu$  and  $\lambda$  characterize the rate of removal from the population and the rate of infection respectively.
