"Influence of Seated Structural Elements of Circular Parts on Coaxial Error in a Joint"

Tr. Ufim. Aviats. In-t. [Works of Ufim Aviation Institute], No 21, 1971, pp 7-13, (Translated from Referativnyy Zhurnal, Raketostroyeniye, No 2, 1972, Abstract No 2.41.224 from the Resume).

Translation: This work states the problem of determining the influence of basic errors in the manufacture of parts (eccentricity of seated surfaces, radial clearance Δ and end skew) on bending of axes with certain assembly plans. Evaluation of the these plans from the standpoint of maximum possible skew of the axes is of significant interest for designers in selecting plans for joints and assigning tolerances for their manufacture. 4 Figures.

"Preparation of Thin Magnetic Films With Special Properties by an Electrochemical Method"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 46, No 1, Jan 73, pp 52-56

Abstract: Since magnetic properties of the films obtained by the electrochemical method are affected by their composition, thickness, conditions of the electrolysis, acidity of the electrolytes and by other parameters, a study was undertaken of the effects of these parameters on thin magnetic films. It was established that lowering the coercive force to 3e and improvement in the anisotropy of these films may be achieved by depositing them in pulsed mode using interstitial layers of copper, and a brass base. The use of the pulsed mode may promote directional orientation of the crystals and by keeping them in a fine crystalline form improve their magnetic properties.

"Method of Electrolytic Deposition of a Nickel-Iron Alloy"

USSR Author's Certificate No 308098, filed 22 Oct 68, published 26 Aug 71 (from RZh-Khimiya, No 6 (II), Jun 72, Abstract No 61316P)

Translation: A procedure for electrolytic deposition of Ni-Fe alloy has been patented. It is distinguished by the fact that in order to obtain the magnetic anisotropy of thin films, the process is realized with the application of a square-pulse direct current with a period of 11-20 seconds, a pulse time of 10-15 seconds, an off-duty factor of 1.1-1.5 and an amplitude of 3-5 a. The films obtained are characterized by magnetic anisotropy with a coercive force of 4-8 oersteds and an anisotropy field of 3-7 oersteds. The minimum values of the coercive force and the anisotropy field (2-4 oersteds) are achieved for a pulse period of 15 seconds (the pulse time was 10 seconds, the off-duty factor was 1.5) and an amplitude of 4 a/dm² during the electrolysis process with D_c 1 a/dm².

"The Application of Variational Methods to Solution of Boundary Value Problems for Equations of Mixed Type in Near-Sonic Gasdynamics"

Kazan', Izvestiya VUZov: Matematika, No 9(124), Sep 72, pp 76-83

Abstract: The calculation of many near-sonic flows of ideal gas leads to boundary value problems for equations of mixed type. In S. G. Mikhlin's book "Variational Methods in Mathematical Physics" (Moscow, "Nauka", 1970) variational methods were applied to the solution of boundary value problems for equations of elliptical type -- the problem of integrating a differential equation was reduced to the problem of finding a function which minimizes a certain integral. In this paper the author considers a boundary value problem for an equation of mixed type which is a generalization of the approximate near-sonic equation for a stream function and the equation for the transformed stream function. The article comprises four sections. In the first, the solution of the boundary value problem is reduced to finding a function which minimizes some quadratic functional defined on the set of partial solutions of the differential equation. In the second section a

1/2

OREL, A. A., Izvestiya VUZov: Matematika, No 9(124), Sep 72, pp 76-83

system of partial solutions is found and used in constructing a solution of the boundary value problem with a continuous boundary condition. The problem with a discontinuous boundary condition is considered in section 3. In section 4 the results are applied to solving the problem of near-sonic flow of an ideal gas through a Laval nozzle with given walls which become two parallel straight lines at infinity upstream; a condition is found which defines the flow of gas through the given nozzle. The author thanks S. V. Fal'kovich for guidance and continued interest in the work.

"Adoption of the Industrial Production of 15G2AF Sheet Steel"

Moscow, Stal', No 9, Sep 70, pp 828-830

Abstract: An investigation of the 15G2AF plate steel (10-25 mm), commercially produced at the Kommunarsk Metallurgical Plant, revealed that alloying of the manganous structural steel with nitrogen and vanadium increases the strength and plasticity properties of the normalized rolled steel. Normalizing of the metal effects a size reduction of the grain (to 10-12), which assures a low (-100°C to -120°C) cold brittleness threshold. The strength of the 15G2AF steel was found to be at least 60 kg/mm² and the yield stress at least 45 kg/mm². Use of 15G2AF steel for welded structures decreased weight, in comparison with steel 10G2S1, by 13.6%.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A TOTAL OF 54 PATIENTS WITH ACUTE RENAL INSUFFICIENCY OF VARIOUS ETIOLOGY WERE EXAMINED. TOTAL ACTIVITY OF LACTATEDEHYDROGENASE AND ACTIVITY OF ISOENZYMES OF LACTATEDEHYDROGENASE IN THE BLOOD PLASMA DURING OLIGOANURIA WAS DETERMINED IN 39 PATIENTS. ISOENZYMES OF LACTATEDEHYDROGENASE OF THE BLOOD PLASMA AND URINE DURING RESTORATION OF THE RENAL FUNCTION WERE STUDIED IN 15 PATIENTS. AN INCREASE OF THE LACTATEDEHYDRATE ACTIVITY IN THE BLOOD AND URINE MAINLY AT THE EXPENSE OF RAPID MOVING ISOENZYMES WAS NOTED. THE TOTAL ACTIVITY OF LDG OF THE BLOOD WAS NOT CHARACTERIZED BY THE EXTENT OF THE RENAL TISSUE INJURY. ALL FIVE ISOENZYMES OF LDG WERE REVEALED IN THE URINE. WITH RESTORATION OF THE RENAL FUNCTION THE ACTIVITY OF ISOENZYMES IN THE BLOOD AND URINE BECAME NORMALIZED. THE DYNAMIC OBSERVATION OVER THE CHANGE IN THE ACTIVITY OF LDG MADE IT POSSIBLE TO JUDGE UPON THE RESTORATION OF THE RENAL FUNCTION.

XIII-6. EFFECT OF THE SUBSTRATE ORIENTATION ON THE GROWTH AND PROPERTIES OF EPITAXIAL LAYERS

Article by S. A. Grahov, F. P. Krasovskiy, V. F. Kovalenko, I. Ye. Meremennik, B. T. Mamonko, V. I. Orel, N. N. Puzoskiy, Svetlovodsk: Novosibirsk. III Simpozium po Prolivaniyu, Nostri i Sintezu Poluprovodnikov Kristalloy i Plozod. Novosibirsk, 12-17 June 1972, p 187

The epitaxial layers of solid solutions of $Al_{1-x}Ga_xAs$, $Al_xGa_{1-x}As$ were grown from a solution in a pallium melt in a hydrogen flux on gallium arsenide plates with an orientation of 100, 111, 111A and on the 100 planes disoriented to 111B by 3° and 10° .

The effect of the orientation plane on the growth rate, morphology, electrical parameters and photoluminescence intensity was investigated. The layers most improved with respect to morphology were obtained on singular planes. The distribution of the composition in the $Al_{1-x}Ga_xAs$ layers with respect to thickness is observed as a function of the substrate orientation plane. The most uniform layers were obtained for growth on substrates oriented in the 111B plane. In pure layers of $Al_{1-x}Ga_xAs$ with a concentration of less than $5 \cdot 10^{15} \text{ cm}^{-3}$, a deep level is observed (for example, for $x = 0.3$ the activation energy of the level $E = 0.12$ electron volts). On the basis of the layers of solid solutions of $Al_{1-x}Ga_xAs$, $Ca_{1-x}Mg_xAs$ obtained, like diodes were manufactured with a brightness to 1,000 at for a current of 10 milliamperes.

"A Catch for Disconnecting the Free Ends of the Suspension System of a Parachute"

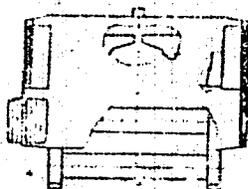

Moscow, Otkrytiya, Izobreneniya, Promyshlennyye Obratzsy, Tovarnyye Znaki, No 21, Jul 73, Author's Certificate No 380537, Division B, filed 9 Apr 71, published 15 May 73, p 67

Translation: This Author's Certificate introduces a catch for disconnecting the free ends of the suspension system of a parachute. The device contains a housing with a cover on which trigger releases and a safety lock are mounted. Enclosed in the housing are fasteners which hold the free ends of the parachute suspension lines. As a distinguishing feature of the patent, locking reliability of the catch is improved by making the safety lock in the form of a spring-loaded pushbutton installed on the cover perpendicular to the plane of the housing.

"Development of a New Brand of Optical Quartz Glass"

Leningrad, Optiko-Mekhanicheskaya Proymshlennost', No 12, December 1971,
pp 42-45

Abstract: To satisfy a recently arisen requirement for quartz glass having high transparency, it became necessary to produce an especially pure synthetic raw material, with a total admixture content not exceeding 1×10^{-5} to $1 \times 10^{-6}\%$. At an unnamed plant there was tested a number of lots of silicon dioxide, obtained by hydrolysis of the ethyl ester of orthosillicic acid. On the basis of an investigation of the optical properties of the obtained samples of glass, it was shown that the best raw material is the "Irea" band of silicon dioxide. The melting of quartz glass directly from a "cake" of crystalline silicon dioxide improves the production process, and shortens the technological cycle of the creation of the intermediate products, without decreasing their quality. 1 figure. 4 tables. 3 references.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A REDUCED MOTORICITY OF THE DUODENUM IS ONE OF THE MAIN CHAINS IN THE PATHOGENESIS OF CHRONIC PANCREATITIS. IN CONDITIONS OF HYPOKINESIS OF THE INTESTINAL WALL THERE OCCUR PREREQUISITES FOR STASIS OF BILE AND PANCREATIC JUICE ABOVE THE ODDI'S SPHINCTER. ON THE OTHER HAND, DUODENAL HYPOTENSION CAUSES SECONDARY DILATATION OF THE SPHINCTER OF ODDI, THIS LEADING TO CONSTANT INFECTION OF THE DUCTS WITH ENZYME ACTIVE INTESTINAL CONTENTS. THUS, CHRONIC RECURRENT PANCREATITIS IS MAINTAINED. FOR THE TREATMENT OF HYPOKINETIC STATES OF THE DUODENUM IN 42 PATIENTS THE AUTHORS EMPLOYED ELECTRIC STIMULATION OF ITS MOTORICITY WITH A WEAK ELECTRIC DISCHARGE. ACTING UPON THE INTESTINAL PACEMAKER, SITUATED IN THE ZONE OF VATER'S PAPPILLA, THE AUTHORS INTENSIFIED THE INTESTINAL MOTOR ACTIVITY IN PATIENTS WITH EARLY FUNCTIONAL STAGES OF CHRONIC PANCREATITIS, ATTAINING A POSITIVE CLINICAL EFFECT. THE TECHNIQUE OF ELECTRIC STIMULATION OF THE DUODENUM IS SIMPLE, SAFE, WELL TOLERATED BY PATIENTS AND MAY BE USED FOR NORMALIZATION OF THE MOTORICITY OF ALL INTESTINAL REGIONS. ELECTRIC STIMULATION IS DEEMED PERSPECTIVE IN THE TREATMENT OF POSTOPERATIVE PARESIS, FUNCTIONAL DUODENOSTASIS, DISKINESES, PANCREATOPATHIA, SOME FORMS OF NONCLACULOUS CHOLECYSTITIS, DUDDENITIS AND PERSISTENT CHRONIC COLITIS.

"Morphological Changes in the Lungs Produced by Single Hot Particles Experimental Study"

Moscow, Meditsinskaya Radiologiya, No 4, 1970, pp 52-56

Abstract: About 100 hot particles (particles of Co^{60} 10-20 microns in size with an activity of 10^{-8} to 10^{-9} C) in 0.2 ml of physiological saline were injected into the jugular vein of rats. Morphological changes in the lungs were studied 5-30 days thereafter. No significant changes were observed in the energy absorption zone. The zone of absorption of doses of 10^2 and 10^6 rads occupied a space with a radius of 200 microns, while destructive changes appeared only within a radius of 15-20 microns. Although there was an absence of focal necrosis, changes were noted in the blood vessels containing particles - homogenization and loss of structure of the walls, swelling of collagenous and argyrophil fibers. The intensity of the destructive processes was unrelated to the size of the radiation

dose. After 20-30 days, besides the vascular changes, desquamation and necrobiosis of endothelial cells, there were signs of proliferation of cellular elements in the adventitia. The radioactive particles had no effect on the adjacent structures. Thus, the changes observed appear to be comparatively insignificant from the standpoint of injury to lung tissue and impairment of respiratory function.

"Free Convection in a Horizontal Cylinder"

Tr. VNII po Sboru, Podgotovke i Transp. Nefti i Nefteproduktov [Works of All-Union Scientific Research Institute on the Collection, Preparation and Transportation of Oil and Petroleum Products], No 8, 1971, pp 104-116, (Translated from Referativnyy Zhurnal, Mekhanika, No 4, 1972, Abstract No 4 B647 by Ye. M. Zhukhovitskiy).

Translation: Free, unstable convection in an infinite horizontal circular cylinder is studied. The wall temperature of the cylinder is maintained constant and differs from the temperature of the fluid. The temperature difference and size of the cavity are assumed sufficiently great that convection occurs in the boundary-layer mode. The problem is solved on the assumption of quasistability of the process: it is considered that the structure of the flow is determined at a given moment in time by the instantaneous temperature difference between the walls and the fluid and is independent of the rate of change of temperature with time.

The equations for planar, stable convective motion in the boundary layer approximation are solved by the Karman-Polhausen method. Laminar and turbu-

GUBIN, V. Ye., ISUPOV, Yu. G., ORESHINA, M. D., KHAZIYEV, N. N., SHEMYAKINA, G. N., Tr. VNII po Sboru, Podgotovke i Transp. Nefti i Nefteproduktov, No 8, 1971, pp 104-116.

lent flow modes are studied. The velocity and temperature are approximated by polynomials. The Reynolds analogy is used in the turbulent case. The solution of the nonlinear systems of equations for the velocity and thickness of the boundary layer is produced by the method of power series using a longitudinal coordinate. Furthermore, an analytic solution in the area of large Prandtl numbers is found in the laminar case. The boundary layer characteristics and heat flow through the surface of the cylinder are calculated. Results are presented from an experimental study performed using two models with diameters of 30.5 and 97.5 cm and lengths of 15 and 27 cm respectively. The working fluids were gasoline and distilled water. Processing of the experimental data produced on heat transfer produces the dependence $N = 0.340 (GP)^{0.25}$ in the laminar case and $N = 0.092 (GP)^{0.40}$ in the turbulent case (Nusselt number N and Grashoff number G defined through diameter of cylinder and temperature difference between wall and fluid; P is the Prandtl number). Heating time of the fluid is estimated.

With Heating on the Side"

Moscow, Zhurnal Prikladnoy Mekhaniki i Tekhnicheskoy Fiziki, No 1, 1971,
pp 123-126

Abstract: Some results of experimental research on free convection in solutions with nonuniform density with respect to height are presented. It is shown that in the presence of a vertical density gradient and side heating, the convective motion in solution is of a cellular character. The relationship of the height of individual cells to the temperature pressure and the density gradient is ascertained. 2 figures, 5 bibliographic entries.

"Concerning Migration Polarization in Dielectrics and Semiconductors"

Tomsk, Izvestiya Fizika, No 5, 1970, pp 13-16

Abstract: It is shown that in migration polarization the relaxation time is determined by the lifetime of the carriers in a fixed state, by the thickness of the layer through which the migration transpires, and by the drift velocity. For ion migration a formula is obtained as a generalization of the ion-relaxation polarization formula. Experimental data are presented with regard to the determination of ion mobility in Al_2O_3 by the Ioffe method, and a comparison was made with the values of mobility that were determined by the author's method with the use of formulas for the relaxation time. The necessity was pointed out for examining migration polarization when analyzing the mechanism of excess noise and some cases of current fluctuations in semiconductors, relaxation dielectric losses, relaxation phenomena in active film elements, etc.

"Production and Investigation of Local Inhomogeneities in Oxide Semiconductors"

Tomsk, Izvestiya Vysshikh Uchebnykh Zavedeniy, Fizika, February 1970, pp 16-18

Abstract: The introduction of impurities into oxide semiconductors by a method of electron transfer is described. It is shown that in electron transfer it is possible to produce local inhomogeneities in the samples. Several physical properties of the samples are studied, and it is found that electron transfer leads to a change in these properties.

"Study of Wear Resistance of Surfaces Hard Faced with Borides"

Poroshkovaya Metallurgiya, No 3, Mar 71, pp 78-82

Abstract: High-alloy hard faced layers formed of the borides of titanium, chromium, and tungsten were studied, as well as titanium-chromium diboride with a molar ratio $TiB_2; CrB_2=4:1$. All of the coatings were subjected to x-ray phase analysis. X-ray analysis indicated that the initial powders consisted of titanium diboride, a dual titanium-chromium diboride, a mutual solid solution based on TiB_2 and chromium diboride, a mixture of the phases CrB_2 and Cr_3B_4 , as well as W_2B_5 . The boride facings have excellent use properties resulting from the exceptionally high alloying ability of the facing layer, produced by introducing several refractory components which have different influences on the general properties of the alloy but give it an excellent structure.

"Effect of Composition on the Strength of Mg-Nd Alloys by the Method of High Temperature Thermomechanical Treatment"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 5, Sep-Oct 72, pp 144-146

Abstract: Results are presented on investigations into the effect of neodymium content on the mechanical properties and structure of Mg-Nd alloys subjected to both high temperature thermomechanical treatment (HTTMT) and conventional heat treatment-T6. HTTMT consisted of heating ingots to 535°C and soaking for two hours, air cooling to 300°C and then extruding the alloy at this temperature into rods 10.5 mm in diameter. The degree of hot deformation was 87%. For the T6 treatment the ingots were extruded at 450°C, heated to 535°C for one hour, water quenched, and then aged at 200°C for eight hours. Mechanical tests were performed at room temperature and at 250°C.

At room temperature the highest tensile strength was about 32 kG/mm² for the alloy with 3% Nd; the highest yield strength and elongation were also exhibited at this Nd content. At 250°C, the highest tensile strength was still at 3% Nd but only amounted to 19 kG/mm²; however, at 250°C and a Nd content of almost 4% the elongation was 40% as compared to 8% for the

"High Temperature Thermomechanical Treatment of Deformable Magnesium-Neodymium Alloys"

V sb Struktura i svoystva legk. splavov (Structure and Properties of Light Alloys -- collection of works), Moscow, Nauka Press, 1971, pp 127-136 (from Kzh-Metallur-giya, No 4, Apr 72, Abstract No 41701)

Translation: A study was made of the effect of high-temperature thermomechanical treatment on the mechanical properties and structure of deformable Mg-alloys alloyed with Nb: MA11 (Mg-Nd-Mn-Ni) and MA12 (Mg-Nd-Zr). With a degree of deformation of 87%, the optimal conditions of high-temperature thermomechanical treatment for the MA11 alloy is heating the ingots to 490° for two hours, partial cooling and pressing at 350°, and for the MA12 alloy, heating the to 530° for two hours, partial cooling and pressing at 300°. Utilization of the indicated high-temperature thermomechanical treatment conditions by comparison with the T6 conditions used for these alloys at the present time (quenching and aging) offers significant advantages with respect to strength characteristics at room temperature and defined advantages (especially with respect to σ_T) at 250°: δ of the alloys after high-temperature thermomechanical treatment is 1/1

USSR

DRITS M. E., et al., Struktura i svoystva legk. splavov, Moscow, Nauka Press, 1971, pp 127-136

found to be higher than after low-temperature thermomechanical treatment. A study of the structural variations taking place as a result of high-temperature thermomechanical treatment by the microstructural method, measuring the specific electrical resistance, and the x-ray method demonstrated that the observed hardening is connected with distortions of the crystal lattice of the solid solution rich with Mg and variation of the kinetics of the processes of recovery, recrystallization, and decomposition of the supersaturated solid solution. Four illustrations, one table, and a 7-entry bibliography.

"Precision Digital-to-Analog Converter"

Novosibirsk, Avtometriya, No 2, 1972, pp 88-92

Abstract: The control system for the VEPP-3 storage element using the computer described previously [M. M. Karliner, et al., Avtometriya, No 2, 1972] requires digital-to-analog converters of the potentiometric type which satisfy the following requirements: one digital-to-analog converter must insure a relative error of the division factor of less than $\pm 1 \cdot 10^{-4}$ with a factor varying from 0.1 to 1; the remaining digital-to-analog converters must insure an error of the division factor of less than $\pm 3 \cdot 10^{-4}$ for the input voltage varying from 0.5 to 5 volts. The converters must have galvanic decoupling of the analog part from the control circuits. The circuitry of the digital-to-analog converters, the procedure used in selecting their elements and checking them are described. The converters are executed on the basis of the chmic decoding grid R-2R [P. Campiche, Etude d'un convertisseur numerique analogique. JSR-PO/70-22, Geneva, 1970] and two-position transistor switches. The digital-to-analog converter is selected by means of an address decoder circuit. The characteristics of the 1KT011A and 1KT621 integral breakers used as the switching elements are presented. The results of checking a 16-bit digital-to-analog

"Ventilation of Aerosol Inhalation Rooms"

Moscow, Voprosy Kurortologii Fizioterapii i Lechebnoy Fizicheskoy
Kul'tury, Vol 36, No 1, 1971, pp 72-76

Abstract: The method of treating various diseases by letting patients inhale the aerosols of alkalis, antibiotics, sulfanilamides, bronchodilators, antihistamine, vitamins, corticosteroids, proteolytic enzymes, and other drugs is becoming increasingly more popular. Twenty inhalation rooms in the city of Gor'kiy were studied and found far from adequate. Each inhalation room accommodates three to six persons, each breathing a different aerosol. Because of poor ventilation, significant residual amounts of various drugs remain in the air, yielding an "aerosol bouquet" and causing chronic diseases among the personnel. In contrast, the authors describe the inhalation room designed by them. It contains several individual chambers.

HUMAN MENTAL LABOR AND "MACHINE THOUGHT"

Article by Yu. V. Orfeev, Moscow, Nauchnoye Upravleniye Oshchibestvom, Russian, No. 1971, pp 22-297

According to the predictions of a number of futurologists, the application of electronic computers for automating the creative processes will be quite widespread by 1985. The correct evaluation of the developmental prospects of "machine thought" and its impact on the organization of control entails considering a number of methodological problems connected with the relationship between man's real creative and organized activity.

The first problem involves appraising the areas and limits of the applicability of the functional approach to analyzing control systems. We should dwell on this approach because "machine thought" and human thought are comparable only on the functional plane. The second problem bears on whether machine programs for processing symbolic information can serve as a tool for the construction of paralogic and economic theories. And the third problem pertains to making more specific the criteria for comparing human and machine thought.

Areas and Limits of the Application of the Functional Approach to the Study of Control Systems

The functional approach to studying complex control systems and structures is a productive tool for their analysis. A characteristic feature of the functional approach is the fact that the very specification of the system tends, as it were, on the one hand, while basic attention is focused on the complex of properties determining the behavior of the given system in its interaction with the surrounding environment. The necessity for the functional approach to the study of complex control systems of this type are not directly derived from the structural characteristics of the system. In fact, if the functional properties of machines (turning lathes, arithmometer, watch, and so forth) have

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. AN EXPERIMENT WAS CONDUCTED TO STUDY CHANGES IN THE VESTIBULAR ANALYSOR DURING GREAT MUSCULAR ACTIVITY UNDER CONDITIONS OF INTENSIVE ACCELERATION. FIFTY WRESTLERS, AGED 15 TO 18, PARTICIPATED IN THE EXPERIMENT. WRESTLING WAS CHOSEN BECAUSE OF ITS GREAT MUSCULAR EXERTION, WHICH REQUIRES BALANCE AND MAXIMUM BODILY STABILITY UNDER ACCELERATION. IT WAS CONCLUDED THAT THE VESTIBULAR REACTIONS WHICH OCCUR UNDER AN INTENSIVE MUSCULAR LOAD ARE CHARACTERIZED BY SEVERAL FEATURES. THE FLOW OF VESTIBULOMOTOR REACTIONS IS CHANGED. THIS OCCURS IF THE NYSTAGMIC REACTION IS GREATLY ACTIVATED, THE LENGTH OF THE NYSTAGMUS INCREASES, AND THE NUMBER OF NYSTAGMIC IMPULSES INCREASES, RESULTING IN INCREASE IN THE FREQUENCY OF NYSTAGMUS. THE VESTIBULCAUTONOMIC REACTION, TOGETHER WITH THE PROCESS OF RECUPERATION, CHANGES AND THE FINAL RESULT OF SUCH SUMMATION DEPENDS ON THE STRENGTH AND THE DEGREE THAT EACH IS PREVALENT. AS A RESULT THERE IS SIGNIFICANT DECELERATION IN THE RECUPERATION PROCESS. THE REACTIVE STABILITY OF THE VESTIBULAR ANALYSOR, BY WHICH WE MEAN THE COMPARATIVE VALUE OF THE REACTION PRODUCED TO THE SHORT, ABOVE THRESHOLD STIMULUS WHEN THE ATHLETE EXERTS MUSCULAR STRESS, DECREASES. THIS IS SEEN IN THE ACTIVATION OF THE VESTIBULOMOTOR REACTION. FINALLY, INTENSIVE PHYSICAL WORK UNDER THE INFLUENCE OF ANGULAR ACCELERATIONS LIMITS TO A GREAT EXTENT THE WORK CAPACITY OF A MAN. FACILITY: ARMENIAN STATE INSTITUTE OF PHYSICAL EDUCATION.

ficant deceleration in the recuperation process. The reactive stability of the vestibular analysor, by which we mean the comparative value of the reaction produced to the short, above-threshold stimulus when the athlete exerts muscular stress, decreases. This is seen in the activation of the vestibulomotor reaction. Finally, intensive physical work under the influence of angular accelerations limits to a great extent the work capacity of a man.

Morgunov, I. N.; Orgel', M. Ya.; Grutman, M. I.

The authors studied the role of macrophages of peritoneal exudate of rats in induction of formation of antibodies against sheep erythrocytes or to diphtheritic toxoid under conditions of diffusion chambers present in the irradiated recipients. A conclusion was drawn that marked primary and secondary response in the lymphocyte culture in vivo required macrophage treatment of the antigen. When only the antigen was added to the lymphocyte culture in vivo, the antibody production proved to be less than on addition of macrophages which came in contact with the antigens before.

XII-6. PROBLEMS OF OBTAINING EPITAXIAL LAYERS OF SILICON AT REDUCED TEMPERATURES

Article by I. M. Skvortsov, B. V. Orion, Moscow; Novosibirsk, III Stencilium no Professors Rosta I Shturza Polunovodnikovskh Kristallov I Pioner, Russian, 12-17 June 1972, p 197

In the report a study was made of methods of obtaining epitaxial layers of silicon from a mixture of SiCl₄ and H₂ at temperatures below 1,000° C. The experimental results and a comparison of the layer growth methods are presented.

An analysis of the experimental results conclusions to be drawn regarding the causes of worsening of the structure of the layers at reduced temperatures, the basic cause is oxidation of the silicon surface by the moisture contained in the gas mixture. By calculation, the effect of the moisture in the hydrogen on the minimum temperature at which it is possible to have epitaxial growth was determined.

In order to obtain no-defect epitaxial layers at reduced temperatures, various methods of preparing the substrates are proposed which prevent oxidation of the surface. Careful cleaning of the substrate before growth prevents epitaxial growth of silicon at a temperature of below 1,000° C, bypassing the stages of high temperature growth and high temperature film etching.

"Concerning the Effect of Impurities on the Growth of Epitaxial Layers of Silicon at Low Temperatures"

Elektron. tekhnika. Nauch.-tekh. sb. Poluprovodn. pribory (Electronic Technology. Scientific and Technical Collection. Semiconductor Devices), 1971, vyp. 4(61), pp 99-106 (from RZh-Fizika, No 4, Apr 72, Abstract No 4A738)

Translation: The authors consider low-temperature growth of epitaxial layers of silicon from $\text{SiCl}_4\text{-H}_2$ and SiHCl_3H_2 mixtures. The basic cause of impairment of the structure of the layers at low temperatures is surface oxidation of the silicon by water contained in the purified hydrogen. Calculation shows the effect which the dew point of hydrogen and the partial pressure of hydrogen chloride have on the surface oxidation of silicon. From the results of the calculations, conditions were brought about for producing epitaxial layers of silicon at temperatures of 950-1000°C with a stacking defect density of less than 50/sq. cm. Moscow, Vestnik Moskovskogo Universiteta, Seriya III, Fizika, Astronomiya, Vol 12, No 4, Jul/Aug 71, pp 363-369

Abstract: The solution of the Fresnel equation for a gyrotropic medium is taken as a basis in deriving general expressions for the vectors of electromagnetic field polarization in this medium. A relation is established between two known approaches to solution of the problem of radiation by a charged particle in the given medium. The resultant general formulas are applied to the case of radiation by a charged particle moving in a helical line in a gyrotropic medium. The authors thank A. A. Sokolov for discussing the results. "Abiding Strictly by Regulations for Pesticides Applications"

Moscow, Zashchita Rasteniy, no 12, 70, pp 3-6

Abstract: In recent years, the application and storage of pesticides have been greatly regulated. However, inspections conducted over a number of republics revealed violations. It was observed, for instance, that pesticides have been frequently used without preliminary determination of the degree of contamination of the fields. As a consequence some fields were unnecessarily treated with polychloropinene mixed with DDT. Moreover, the preparation of soil for beets frequently followed immediately without the observance of the waiting period specified by law, thus creating a hazard to the health of the kolkhoz farmers. Control analyses of 85 samples of pesticides taken in kolkhozes and sovkhozes have shown only

1/2

USSR

ORISHCHENKO, A. D., Zashchita Rasteniy, No 12, 70, pp 3-6

25 to be in proper solutions. Names and locations of farms where solutions of insecticides, fungicides and herbicides were incorrectly prepared are given. Such violations involving excessive concentrations of pesticides caused burns of plants over large areas, and damage to grain treatment. Application techniques are equally inefficient. Coordination is lacking between the material, method of application and the weather. Recommendations are made for eliminating these shortcomings, by supplying educational material, better practical training, wider application of agrotechnical, biological as well as other non-chemical techniques for preventing the mass propagation of pests and plant diseases.

"For High Quality Aerial Spraying of Crops"

Moscow, Zashchita Rasteniy, No 4, 1971, pp 3-5

Abstract: Aerial spraying of toxic chemical to protect crops against pests and diseases is often less effective and more costly than it should be because of the failure to follow the rules set forth by the USSR Ministry of Agriculture. Spraying is often done in disregard of weather conditions, appropriate time of day, and so forth. Both the spraying devices and the planes used are not kept in good working condition. The pesticides are often sprayed in large rather than small drops, a generally wasteful procedure. Moreover, many farm directors, local agricultural agencies, and plant protection stations are negligent and indifferent to the need for proper organization of the work. Specific examples are given to illustrate the shortcomings of present spraying practices in various parts of the country.

"An Experimental Stand for Studying Models of Electrogasdynamic Energy Converters"

Sb. nauch. tr. Kiyev. in-t inzh. grazhd. aviatsii (Collected Scientific Works. Kiev Institute of Civil Aviation Engineers), 1971, vyp. 7, pp 34-38 (from RZh-Mekhanika, No 7, Jul 72, Abstract No 7B68)

Translation: A description is given of the experimental equipment, the technique, and some results of measurements on models of electrogasdynamic generators. Methods of obtaining charged particles for the emitters in electrogasdynamic generators are considered: with an external charge-separating field, the method of electrolytic pulverization, and the condensation method. A charged-particle production scheme is given for an AC electrogasdynamic generator. A diagram is given together with the result of measurement of the load characteristic of an electrogasdynamic generator with formation of a high-resistance film on the channel wall. Current-voltage characteristics are presented for an emitter with applied electric field on a hydrocarbon flame with various coefficients of oxygen excess. Author's abstract.

"Use of Circuit Theory Methods for Problems on Waveguides Partially Filled With a Dielectric"

Moscow, Radiotekhnika, Vol 25, No 3, March 70, pp 37-43

Abstract: On the basis of circuit theory methods this paper determines the propagation constant of the principal wave in rectangular and circular waveguides partially filled with a dielectric, such as are widely used in the development of broadband phase-shifting devices. A graph is presented of the dependence of the propagation constant of the principal wave ($\lambda = 3.2$ cm) on the thickness of a dielectric bar located in the center of a rectangular 23 x 10 mm waveguide. The graph agrees with experimental data from the bibliography. A circular

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ON THE BASIS OF CIRCUIT THEORY METHODS THIS PAPER DETERMINES THE PROPAGATION CONSTANT OF THE PRINCIPAL WAVE IN RECTANGULAR AND CIRCULAR WAVEGUIDES PARTIALLY FILLED WITH A DIELECTRIC, SUCH AS ARE WIDELY USED IN THE DEVELOPMENT OF BROADBAND PHASE SHIFTING DEVICES. A GRAPH IS PRESENTED OF THE DEPENDENCE OF THE PROPAGATION CONSTANT OF THE PRINCIPAL WAVE (λ EQUAL 3.2 CM) ON THE THICKNESS OF A DIELECTRIC BAR LOCATED IN THE CENTER OF A RECTANGULAR 23 TIMES 10 MM WAVEGUIDE. THE GRAPH AGREES WITH EXPERIMENTAL DATA FROM THE BIBLIOGRAPHY. A CIRCULAR ABSTRACT: WAVEGUIDE OF RADIUS R, WITH DIELECTRIC PLATES OF THICKNESS D AND HEIGHT H, IS REPRESENTED IN THE FORM OF A COLLECTION OF STEPS OF RECTANGULAR WAVEGUIDES. CURVES ARE PRESENTED ON THE DEPENDENCE OF K_{SUBZ} (PROPAGATION CONSTANT OF THE PRINCIPAL WAVE) ON $R-\lambda$ FOR A CIRCULAR WAVEGUIDE WITH RECTANGULAR DIELECTRIC INSERTIONS IN A VERY WIDE RANGE OF FREQUENCIES. CURVES ARE ALSO GIVEN FOR THE DEPENDENCE OF K_{SUBZ} ON THE HEIGHT OF THE DIELECTRIC INSERTION. COMPARATIVE RESULTS OF CALCULATIONS AND EXPERIMENTS ARE PRESENTED. EXPERIMENTALLY, K_{SUBZ} WAS DETERMINED BY THE MAGNITUDE OF THE PHASE ADVANCE WHICH IS CREATED BY A TEFLON DIELECTRIC INSERTION IN A 46 MM DIAMETER CIRCULAR WAVEGUIDE. THE DIMENSIONS OF THE PLATE: D EQUAL 6 MM; H EQUAL 16 MM. 8 FIG. 5 REF. PAPER RECEIVED 30 OCT 68. FACILITY: SCIENTIFIC AND TECHNICAL SOCIETY OF RADIO ENGINEERING, ELECTRONICS, AND COMMUNICATION IM. Abstract: waveguide of radius r , with dielectric plates of thickness d and height H , is represented in the form of a collection of steps of rectangular waveguides. Curves are presented on the dependence of K_z (propagation constant of the principal wave) on r/λ for a circular waveguide with rectangular dielectric insertions in a very wide range of frequencies. Curves are also given for the dependence of K_z on the height of the dielectric insertion. Comparative results of calculations and experiments are presented. Experimentally, K_z was determined by the magnitude of the phase advance which is created by a Teflon dielectric insertion in a 46-mm diameter circular waveguide. The dimensions of the plate: $d = 6$ mm; $H = 16$ mm. 8 Fig. 5 ref. Paper received 30 Oct 68.

"Effect of the Equations of State on the Dispersion of Detonation Products"

Moscow, Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, No 2, 1973, pp 165-170

Abstract: Results are given in this paper of the numerical solution of problems of the dispersion of detonation products for various forms of the equation of state. Recognizing that a number of different equations of state have been advanced by the literature on detonation products, the authors select the simplest form of the equation which provides sufficient accuracy for the practical solution of problems on detonation product dispersion. An expression for the logarithmic slope of the isentrope is also obtained. Curves are plotted for the pressure, density, and mass velocity spectra for plane, cylindrical, and spherical detonation waves. The analysis shows that the equation of state in simple form and the expression obtained for the isentrope can be used for computing explosion problems with a sufficient degree of accuracy.

**INTENSIFICATION OF THE CLINICAL EFFECTIVENESS
OF PARENTERAL NUTRITION**

R. M. Glants, Yu. M. Orlenko, F. F. Usikou

Summary

During clinical investigations conducted in 89 patients with gastroduodenal ulcers the authors established that during resection of the stomach in the postoperative period there occur a rise of catabolism of nitrogen with its intensified excretion, increase of metabolism and function of the cortical part of the adrenals, etc. These metabolic disturbances limit the volume of utilization of introduced nutritive substances. For intensification of the effect of parenteral nutrition it is necessary to combine the introduced with metabolic regulators: in the administration of carbohydrates — insulin, in the introduction of proteins — anabolic steroids, vitamins. This significantly enhances the assimilation of the substances introduced, normalizes metabolic disturbances, significantly reduces the quantity of required water and, thus, augments the effectiveness of parenteral nutrition.
