

HORIZONTAL STRUCTURAL WIND VELOCITY FUNCTION IN THE UPPER ATMOSPHERE

[Article by Candidate of Physical and Mathematical Sciences G. M. Tsvetin, A. N. Parkhomenko, Kazan' State University; Moscow, "Naukova Dumka", 1972, submitted 4-5 July 1971, pp. 100-105.]

A study was made of the horizontal structural function at

altitudes of 80-100 km in the scale range of 5-200 km with respect to radio reflections from meteor trails obtained on a radar with an angle barge. The maximum horizontal scale of the turbulence was 30-40 km; the anisotropy of the structural functions was established relative to the mean wind direction.

One of the most important properties of the radiometric method of studying atmospheric movements by comparison with other methods is the possibility of investigating large-scale turbulence. In this paper a study is made of the properties of the spatial structural function $D_{\bar{U}}(\vec{r})$ for the medium and large scales.

$$D_{\bar{U}}(\vec{r}) = |U_1(\vec{r} + \vec{r}) - U_1(\vec{r})|$$

where $U_1(\vec{r} + \vec{r}_1)$ are the projections of the wind velocity in the horizontal plane in the direction of the radar at points with a relative distance \vec{r} .

Knowing the coordinate of the reflecting points, it is possible to determine \vec{r} by the formula

$$\begin{aligned} r \cdot \sqrt{[R_1 \sin Z_1 \cos A_1 - (R_2 \sin Z_2 \cos A_2 + U_{\bar{U}} \tau)]^2 + [R_1 \sin Z_1 \sin A_1 - \\ - (R_2 \sin Z_2 \sin A_2 + U_{\bar{U}} v)]^2}, \end{aligned}$$

where R , A , Z are the range, azimuth, and zenith angle of the reflection points, $U_{\bar{U}}$, v are the projections of the mean velocity \bar{U} in the northerly and easterly directions.

TEPTIN, G. M.

"On Calculating the Effect of Antenna Radiation Patterns in Determining the Parameters of Atmospheric Movements"

V sb. Meteorn. rasprostr. radiovoln (Meteoric Propagation of Radio Waves -- collection of works), vyp. 7, Kazan', Kazan' University, 1970, pp 108-115 (from RZh-Radiotekhnika, No 12, Dec 70, Abstract № 12659)

Translation: The author demonstrates the necessity of accounting for horizontal anisotropy of turbulence when calculating the distortions in the parameters of atmospheric motions resulting from the effect of radiation patterns when these motions are determined by the method of radar location of meteors; the procedure of accounting for this anisotropy is outlined. Corrections are calculated for a three-element and a five-element antenna of the "wave channel" type. Two illustrations, bibliography of two titles. N. S.

Spectra of Wind Velocity at Altitudes 80-100 km

(Abstract: "Characteristics of Wind Velocity Spectra at Altitudes 80-100 km," by G. B. Pokrovskiy and G. M. Tentin, Kazan' State University; Moscow, Izvestiya Akademii Nauk SSSR, Fizika Atmosfery i Okeana, Vol. VI, No 2, 1970, pp 127-133)

The spectra of atmospheric movements at altitudes 80-100 km, computed in overlapping intervals with periods from 3 hours to 28 months, reveal a number of peculiarities. On the one hand, there is a similarity to circulation in the lower atmosphere. There is a clearly expressed synoptic maximum which is also observed for ionospheric movements. The degree of expression of this maximum is of the same order of magnitude as in the surface layer. Other periodicities are observed which are similar to variations in the lower atmosphere (annual, quasiseannual, and others). On the other hand, differences are also noted. In place of a mesometeorological minimum in the spectrum at meteor altitudes there are strongly expressed variations with periods of 12, 24 and 8 hours, caused by the solar tidal effect. In the spectrum of variations in circulation with large periods, in the zonal component of the wind the decisive variation has a

Reel/Frame
19760537

12

AP0042562

semianual period which is characteristic for the most part for the upper atmosphere and which is observed in density variations at altitudes \sim 200-1,000 km. Variations with an 8-month period are also observed; they are particularly important for the zonal wind component. However, this latter periodicity requires further confirmation on the basis of more abundant statistical data.

"A Method of Deforming the Characteristic of a Nonlinear Device"
Leningrad, Priborostroyeniye, No 2, 1972, pp 37-40

Abstract: A method is proposed, in this theoretical article, for taking into account the effect of higher harmonics in the harmonic linearization of piecewise continuous functions whose second derivatives do not vanish. The case in which the use of nonlinear control laws require harmonic linearization of one and two-valued piecewise linear functions is discussed together with an example. The author considers another approach to the problem based on an examination of the change in the fundamental which occurs as the result of distortion of the nonlinear characteristic by small-amplitude high-frequency components at the input of the nonlinear device. It was found that computations for several practical examples, made in accordance with this method, produce results which agree completely with those of modeling. The author is associated with the S. Ordzhonikidze Moscow Aviation Institute.

"The Effect of X-Rays and Various Combinations of Cytotoxic Substances on Tissue Incompatibility in Rats"

Yerevan, Biologicheskiy Zhurnal Armenii, Vol 24, No 12, Dec 71, pp 68-71

Abstract: The project was conducted in order to prolong the retention periods of a homologous skin transplant on the new host by means of ionizing radiation in conjunction with various cytostatic compounds. In his last report, the author showed that the use of various combinations of immunosuppressants decreases to a considerable degree the reactive potentialities both of the recipient and of the homologous transplant. In the present paper it is shown that the combined use of X-ray irradiation and immunosuppressants sharply reduces immunobiological processes in the animal organism; this, in turn, is reflected in biochemical and morphological changes, as well as in prolongation of the retention periods of a homologous transplant from the new host. In other words, the reactive potentialities, both of the recipient and of the donor, are weakened.

"Combined Effect of X-Ray Irradiation and Immunodepressants on Morphological Changes of Blood and Bone Marrow Cells".

Yerevan, Biologicheskiy Zhurnal Armenii, Vol 25, No 9, 1972, pp 54-58

Abstract: White mice and rats were irradiated and given combinations of cytotoxic drugs (antilymphocytic serum, trimitan, thiophosphamide, and three other drugs) to test the combined effect of such treatment on blood-forming cells. Results were similar in rats and mice. In peripheral blood, quantitative changes included an overall reduction of leukocytes to a minimum by the 4th day after treatment, and variable recovery times from 30 to 90 days after treatment, lymphocytes taking longer than granulocytes. Lymphopenia was noted for a short time in some groups. Hypersegmentation of neutrophils was observed. In the bone marrow the percentage content of hemocytoblasts and myeloblasts decreased somewhat in all groups, mature neutrophils increased somewhat, and lymphocytes and monocytes disappeared altogether. Recovery occurred within 30 days. Combination of immunodepressants and irradiation caused more profound changes in this case. In general, changes in bone marrow cells were reflected

"The Effects of X-Rays and of Some Immunosuppressants on the Immunobiological
Characteristics of the Organism"

Yerevan, Biologicheskiy Zhurnal Armenii, Vol 24, No 3, Mar 71, pp 112-115

Abstract: Rats were irradiated with x-rays in a dose of 300 r. Twenty-four hours later, antilymphocyte serum, thiophosphamide, or trimetin in doses of 0.3 ml, 3 mg/kg, and 2 mg/kg, respectively, were injected. Antilymphocyte serum was obtained by immunizing rats with mouse spleen cells. Administration of immuno-suppressants (cytotoxic agents) was repeated twice per week for four weeks. Combinations of antilymphocyte serum with trimetin, antilymphocyte serum with thiophosphamide, and thiophosphamide with trimetin were used in the same manner. As shown by tests on control rats that had been irradiated but not treated with immuno-suppressants, irradiation resulted in a gradual decrease of the content of gamma-globulins in the blood serum during the next four weeks. The effect of both irradiation and immuno-suppressants resulted in a much greater decrease of the gamma-globulin content. The decrease was generally greatest during the third week of 1/2

USSR

TER-AVETISYAN, A. T., and ALAVERDYAN, M. I., Biologicheskiy Zhurnal Armenii,
Vol 24, No 3, Mar 71, pp 112-115

radiation sickness, with the content of gamma-globulins dropping to zero or close to zero in some instances. The level of alpha- and beta-globulins was affected similarly, while that of albumins rose to some extent. The most pronounced post-irradiation hypoglobulinemia was produced by combinations of immunosuppressants. Simultaneously with the reduction of globulin content, there were decreases in leukocyte count, hemoglobin content, and the erythrocyte count during the 3-4 weeks after irradiation in rats treated with immunosuppressants.

USSR"

Leningrad, Mikologiya i Fitopatobiya, No 6, 1972, pp 428-434

Abstract: Study of the causative agents of orange leaf and stripe rusts of
wheat in different parts of the Soviet Union and some other European countries
showed that, despite the great variety of races, only a few are responsible for
epiphytotics. The main races are fairly constant from year to year. This
stabilization is due to the fact that more than 90% of all the regionalized
wheat varieties in the USSR are susceptible to all races of the pathogens. The
racial composition of the pathogens in the USSR is similar to that occurring
elsewhere in Europe because of the exchange of original forms and use of the

"Sponge Iron for Steel Melting Production"

Moscow, Metallurg, No 7, Jul 73, pp 20-22

Abstract: Investigations at the Novo-Tula Metallurgical Plant has revealed that iron ore concentrates with a maximum concentration degree must be used for the production of sponge iron suitable for remelting in steel melting aggregates. Factors which must be considered when using sponge iron in the capacity of raw material, burden, and substitute for steel scrap, are discussed. The increase of iron content in the iron ore concentrate at maximum reduction degree of 98% leads to the growth of metallic iron in the sponge according to

$$\Delta F_{\text{emet}} = \frac{16\Delta F_{\text{einit}}}{9.5}, \text{ where } \Delta F_{\text{emet}} = \text{increase}$$

"Some Functional and Morphological Characteristics of the Action of Laser
Radiation on the Retina of a Pigeon's Eye"

Yerevan, Biologicheskiy Zhurnal Armenii, Vol 25, No 1, 1972, pp 83-87

Abstract: Experiments were conducted to determine functional changes in the retina following laser irradiation and their relation to morphological changes. The left eye was irradiated three times at 3-day intervals by a defocused laser (wavelength-6943 \AA , pulse repetition rate-2hz, energy-0.1 j/pulse, pulse duration-not more than 35 nanosec.). An electroretinogram was used during and after irradiation to register retinal activity. Negative oscillations in the ERG of the pigeons during direct irradiation shows positive retinal damage. The ERG did not deviate from its usual form when subjected to a test flash of light immediately following laser irradiation. The enucleated pigeon eyes were treated and prepared in dyed, 15 micron sections. The following morphological changes were observed: The left eyes showed acute edema and histiocytic infiltration in the area of the optic disc and of the layer of nerve fiber. At the base of the pecten, with a background of the edema, infiltration with depigmentation and destruction of the pecten tissue structure.

Minsk, Zdravookhraneniye Belorussii, No 6, 1970, pp 66-67

Abstract: The organization of data requires centralized processing of properly classified information which may be suitable for machine processing. For this purpose, a new chart was prepared by the Central Institute of Epidemiology, designed for epidemiological studies and provided with a separate sheet containing 18 points considered essential for centralized processing. At the seminars attended by all epidemiologists, their aides, and all others working with infectious diseases, the various difficulties concerning the particular items in the new chart were resolved. Putting these new charts through the Minsk-22 computer proved accurate, reliable, and time-saving.

Abstract: Form 36, routinely filled out by all Soviet sanitary epidemiological stations, provides detailed information on a great variety of infectious diseases, especially on trends over a period of years and in different parts of the country. It is helpful in assessing the health status at a given time and in planning preventive measures. Form 36 has three sets of indices. The first applies to individual patients and covers completeness of hospitalization, timeliness of hospitalization, laboratory tests, confirmation of diagnoses, etc. The second set of indices concerns activity in epidemic foci, including frequency of detecting a source of infection, completeness of epidemiological inspection of foci, bacteriological examination of individuals who had contact with sick persons, etc. The third set involves systematic bacteriological examinations of mandatory groups (food handlers, workers in central water supply installations, institutionalized

"Planar Segnetoelectric Capacitors for Microwave Devices"

Moscow, Radiotekhnika i Elektronika, Vol 17, No 10, 1972, pp 2241-2243

Abstract: Studies were made of the electric and thermal characteristics of segnetoelectric capacitors for superhigh frequency devices at temperatures corresponding to the paraelectric phase of the segnetoelectric. Planar capacitors of $\text{Ba}(\text{Ti}, \text{Zr})\text{O}_3$, $(\text{Ba}, \text{Sr})\text{TiO}_3$ and SrTiO_3 films obtained by the method of agglomeration on BeO were investigated. For thicknesses of the films of several microns the capacitors have high nonlinearity. A decrease in the initial capacitance of the capacitor with a decrease in the film thickness confirms the known laws of variation of ϵ with thickness of the segnetoelectric layer [E. V. Bursian, et al., *Fizika tverdogo tela*, Vol 6, No 6, 1818, 1964; St. Clucksman, et al., *Zesz. nauk. Wyższa szkoła ped. Katowicech*, No 6, 7, 1968]. The nonlinearity of the films in the investigated thickness range of 3-40 microns varied little. MgO can be recommended as the substrate material. The capacitance and nonlinearity of planar capacitors with a substrate of MgO is lower than in the case of using BeO for the same film thicknesses. Satisfactory nonlinearity is not obtained on sapphire with film thicknesses less than 5 microns. The dielectric losses in the planar capacitors in the centimeter wave

VENDIK, O. G., et al., Radiotekhnika i Elektronika, Vol 17, No 10, 1972, pp
2241-2243

range were defined by the resonator method. To measure the thermal delay constant the investigated capacitor was included in a superhigh frequency circuit to which a weak measuring signal and powerful pulses were fed. The temperature dependence of the capacitance of a planar capacitor is characterized by a highly diffuse peak for film thicknesses less than 10 microns. Capacitors with a SrTiO_3 film applied by the agglomeration method on a BaO substrate made it possible for the first time to realize successful operation of a nondegenerate parametric amplifier in the 2 gigahertz range in the continuous mode.

RAYLEIGH AND COMBINATIONAL SCATTERING
IN THE FIELD OF AN INTENSE WAVE

Ter-Mikavelyan, M. L.; Melikyan, A. O.

Scattering of a light wave by an atom is considered without assuming validity of perturbation theory with respect to the scattered field. The scattered light frequency may be close to ω_2 , which is the frequency corresponding to the energy difference of the two atomic levels. Relaxation of the system is neglected and it is assumed that the strength of the scattered wave field is much smaller than the characteristic atomic values. It is shown that deviation from the usual perturbation theory results depends on the parameter a (11). Scattering of light by a two-level system is first considered; it is shown that besides spontaneous unshifted scattering (23), combinational stimulated scattering with a frequency (24) appears, providing allowance is made for the saturation effect. The magnitude of this scattering is defined by cross section (30). Moreover, in an intense field a two-level system possesses an absorption line at the frequency (25), the cross section being (31). The results are extended to the case of

21

REEL/FRAME
13731092

AP0038049

a many-level system. The transition $1 \rightleftharpoons 2$ is considered by taking into account intermediate levels and nonresonance terms. Additional coherent spontaneous scattering at a double frequency with a cross section (38) appears in this case. Noncoherent stimulated combinational scattering at two additional frequencies (40) and (42) defined by the cross sections (41) and (43) appears. The system will possess absorption at new additional frequencies (45) and (42') defined by cross sections (46) and (47). The formulas correctly describe the limiting transition to perturbation theory formulas.

TER-MKHTAROV, M. S., Candidate of Technical Sciences, Docent, and MUKHIN, V. D.,
Perm' Polytechnic Institute
"Laboratory Work Using Computers"

Moscow, Vestnik Vysshey Shkoly, No 10, Oct 70, pp 39-40

Abstract: The course "Principles of Computer Technology" at Perm' Polytechnic Institute employs a cycle of laboratory sessions in which students become acquainted with the designs of individual calculating devices and acquire skill in using series computers. The technical center for these sessions is the laboratory of the Chair of Computer Technology, which is equipped with a "Minsk-1" digital computer and MN-7, MPT-9-3, EMU-8, EMU-10 analog machines. The choice of subject for the analog machines varies according to the students' specialization. As a rule, the students have no trouble with the analog machines, but do with the digital computer. Therefore, the chair designed a series of laboratory stands for the exercises in digital computer technology. One of the stands is a table design, fed by three-phase voltage. A base of series logic elements of the "Mir-1" system is used, supplemented with auxiliary elements. There are no connections in the stand except for the power 1/2.

USSR

TER-MKHTAROV, M. S., and MUKHIN, V. D., *Vestnik Vysshey Shkoly*, No 10, Oct 70, pp 39-40

circuits, with all inputs and outputs brought out to a patchboard. The stand includes 86 logic elements, including AND-OR-NOT, 3- and 4-input AND, 3-input OR, AND (pulse-potential), delay elements (univibrators), YES elements (power amplifiers), binary signaling elements, and binary code transmitters.

The subjects developed for the laboratory sessions in digital computer technology were designed to give the students practical experience in the design and study of logic circuits, digital computing circuits, and computer components. The cycle of laboratory sessions culminates with teaching the students to work directly with a "Minsk-1." Students majoring in "Automation and Tele-mechanics" are given 14 hours for this, with at least two hours to be spent at the console.

"Equivalence with Respect to Dissipation of Two Systems of Random Quantities"

T r. Gidrometeorol. N-I. Tsentr. SSSR, [Works of USSR Hydrometeorological Scientific Research Center], 1970, No 64, pp 140-145, (Translated from Referativnyy Zhurnal Kibernetika, No 5, 1971, Abstract No. 5V155 by the author).

Translation: The problem of equivalence with respect to dissipation of two sets of normally distributed random quantities is studied from the general standpoint. A new formula is produced for the equivalent number of independent random quantities. A new proof is presented for a formula produced earlier by the author by the method of characteristic functions.

"On Lu¹⁶⁹ Decay"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 34, No. 1, Jan 70,
pp 2-11

Abstract: The conversion electron spectrum of Lu¹⁶⁹ was measured on the $\pi/2$ β -spectrometer of the Institute in the energy ranges 400-900 kev and 1000-1500 kev. Several tens of new lines were observed. A table of transitions in Yb¹⁶⁹ occurring in the decay of Lu¹⁶⁹ is compiled on the basis of these measurements and the data of other authors and covers transition energies from 24 kev to 2300 kev. The transition energies are given together with the mean-square error, and also the intensities of K-conversion electrons, data on the intensities of γ -transitions, calculated conversion coefficients, and the multipolarity. A decay scheme for Lu¹⁶⁹ is given based on all the available data on Yb¹⁶⁹ levels.

"Properties of Concrete with Magnetically Treated Water"

Moscow, Beton i Zhelezobeton, No. 4, Apr 72, pp 32-34

Abstract: Results of research works of the use of magnetically treated water in the production of heavy concretes and heavy concrete articles are reported. Experimental investigations of the Tashkent Zonal Scientific Research Institute of Power Supply and of the Trust of the State Institute for the Introduction of Advanced Technological Operational and Labor Methods in Construction (of the Main Administration for the Construction of Industrial Establishments in the Tashkent Region) revealed that one of the main characteristics of concrete mix prepared on magnetically treated water is its decreased vibration strength. From mathematical processing of experimental data, a formula for the additional growth of the concrete strength with magnetically treated water, depending on the composition of the mix, was developed. The change of rheological indices of concrete mixes, expressed in the decreased vibration viscosity of the mix with magnetically treated water, was established. Data of the optimum method of water treatment are given and

"High-Speed Rolling of Iron and Titanium Powders"

Moscow, Metallurgiya i Khimiya Titana (Institut Titana), Metallurgiya
Publishing House, Vol 6, 1970, pp 100-105

Translation: Results are given for research on conditions of rolling with forced feeding of metal powders. An empirical dependency is established between the thickness of the strip and the productivity of the mill as a function of the value of the roll solution and pressure of the powder support. It is demonstrated that the use of forced powder feeding makes it possible to increase the rolling speed to 3.2 meters per second and more, and to regulate the density of the strip within a wide range. Four illustrations, one table, and two bibliographic entries.

"Corrosion of Powder Metallurgy Titanium in a Damp Atmosphere Containing
Hydrogen Chloride and in Solutions of Hydrochloric Acid"

Moscow, Metallurgiya i Khimiya Titana (Institut Titana), Metallurgiya
Publishing House, Vol 6, 1970, pp 105-111

Translation: The corrosion behavior of powder metallurgy titanium in gases and solutions of hydrochloric acid within the temperature interval 20-80°C is investigated. It is established that at a temperature of 20°C, atmospheric corrosion of powder metallurgy titanium above 3 and 7% solutions of hydrochloric acid is not observed, and in a solution of hydrochloric acid with a concentration up to 10%, slight corrosion is observed after a certain induction period. At 80°C, powder metallurgy titanium corrodes with all concentrations of hydrochloric acid that were studied. The effective energy for activating the process of dissolving titanium specimens is 62.8-71.2 kilojoules per mole. Seven illustrations, one table, and 11 bibliographic entries.

"Influence of Technological Parameters on Properties of Structural
Products Produced by Pressing Titanium Powders"

Sb. tr. Vses. n.-i. i proyektn. in-t titana [Collected Works of All-Union
Scientific-Research and Planning Institute for Titanium], 6, 1970, pp.
94-97, (Translated from Referativnyy Zhurnal-Metallurgiya, No. 1, 1971,
Abstract No.1 G453 by the authors).

Translation: The authors studied the influence of the properties of the
initial powders and technological parameters in the manufacture of
structural products on their mechanical properties. With identical
pressing pressures, the density of products of electrolytic powders is
higher than that of similar products of hydride powders by 4-7%, although
this difference is reduced during heat treatment. Increasing the
sintering temperature of metal ceramic Ti causes an increase in σ_b and δ .
With a heat treatment temperature of 1300°, σ_b is 55-65 kg/mm², δ reaches
11%. 2 figures; 1 table.

"Metal Ceramic Filters of Titanium Wastes"

Sb. tr. Vses. n.-i. i proyektn. in-t titana [Collected works of All-Union Scientific-Research and Planning Institute for Titanium], 6, 1970, pp. 97-99, (Translated from Referativnyy Zhurnal-Metallurgiya, No. 1, 1971, Abstract No.1 G475 by the authors).

Translation: The influence of technological parameters of the manufacture and properties of initial Ti powder on productivity of filters is studied. Pressing of filters should be performed at pressures up to 2 t/cm², sintering at temperatures of less than 1100°. The productivity of filters is determined for filtration of fluids. The dependence of productivity on pressure drop of up to 1 atmosphere and on size and shape of initial powder particles is determined. The throughput capacity for water of filters made of hydride powder is three times higher than the throughput capacity for filters made of electrolytic powder. 2 figures.

"High-Speed Rolling of Iron and Titanium Powders"

Sb. tr. Vses. n.-i. i proyektn. in-t titana [Collected Works of All-Union Scientific-Research and Planning Institute for Titanium], 6, 1970, pp. 100-105, (Translated from Referativnyy Zhurnal-Metallurgiya, No. 1, 1971, Abstract No.1 6474 by the authors).

Translation: The use of forced powder feed allows the rolling speed to be increased to 3.2 m/sec and higher, i.e., to speeds higher than those ordinarily used by several orders of magnitude. The density of the raw rolled product with forced feed can be adjusted over broad limits by changing the powder feed force. Increasing the height of the powder column in the hopper over the mill with gravity powder feed cannot be used to replace forced powder feed, since it does not allow an increase in rolling speed and has no influence on the thickness and density of the raw rolled product. 4 figures.

"Method for Accelerating a Multidimensional Stochastic Approximation"

V sb. Nekotor. vopr. kibernet. (Certain Problems in Cybernetics -- Collection of Works), No 1, Moscow, 1970, pp 92-100 (From RZh-Matematika, No 10, Oct 70, Abstract No 10V121)

Translation: Let $y(X)$ be a random function of the argument $X = \|x_1, \dots, x_m\|^T$ with the distribution $F(y/X)$; $M(X) = M\{y(X)\} = \int y dF(y/X)$ is a regression function with a single maximum at the point $X = 0$. The stochastic approximation process converging to 0 under certain conditions is determined by the relationship

$$X_{n+1} = X_n + a_n \frac{Z_n}{c_n},$$

where

$$a_n > 0; c_n > 0; \lim_{n \rightarrow \infty} c_n = 0; \sum_{n=1}^{\infty} a_n = \infty;$$

$$\sum_{n=1}^{\infty} a_n c_n < \infty; \sum_{n=1}^{\infty} \left(\frac{a_n}{c_n}\right)^2 < \infty.$$

It is proposed that the vector of the increments Z_n/c_n be used with components

"Problems Of Experimental Evaluation Of Waveguide Bunchers"

V sb. 'Jekoriteli' (Accelerators--Collection Of Works), No 2, Moscow, Atomizdat, 1970, pp 102-104 (from RZh--Elektronika i yeye primeneniye, No 12, December 1970, Abstract No 12A362)

Translation: The paper notes that during evaluation of electron linear accelerators with increased requirements, an analytical presentation based on examination of an equation for phase oscillations and the approximate analytical method are unsuitable because of their insufficient precision. It is possible to obtain an improvement of the output parameters if extremal methods of evaluation are used during a choice of the dynamics of the particles in the electron linear accelerator. The problem is considered of a choice of criteria for optimization of the parameters. S.F.

80097m Diolefin hydrocarbons. Aliev, V. S.; Kasimova, A. P.; Tar-Sarkisov, V. G. (Mamedaliev, Yu. G., Institute of Petrochemical Processes, Academy of Sciences, Azerbaijan S.S.R.) Brit. 1,178,475 (Cl. C 07c) 21 Jan 1970, Appl. 03 Mar 1967, 3 pp. Diolefins were prep'd. by catalytic dehydrogenation of olefins under adiabatic conditions in the presence of steam, O₂ and a catalyst composed of Fe₂O₃ 20-30, Cr₂O₃ 43-53, ZnO 20-5, and K₂O 1-2%. Thus, a catalyst composed of Fe₂O₃ 24, Cr₂O₃ 50, ZnO 25, and K₂O 1% was charged into a reactor, and an 81.5-2.5% butylene-contg. starting material fed in at 585-600° at 500 l./hr at 10:1 steam-butene molar ratio, or at 800 l./hr at 20:1 ratio. When the catalyst layer was 0.5 m deep and the steam-butene ratio was 20:1, the O₂ (0.5-1:1 molar ratio) (O₂-butene) was fed above the catalyst. When the catalyst was 1.0 m G.L.p and the steam-butene ratio was 10:1, the O₂ was fed above the catalyst and into the catalyst layer at 2 points. This process gave 36-40% butadiene (I) based on cycled butenes, and 82-5% I based on consumed butenes. Isoprene was similarly prep'd. from isoamylenes.

control. This may be connected with substantial decrease in protein content in this fraction of hepatomas. The specific activity of hepatomas glucokinase in mitochondria from hepatomas 48 and 46 was significantly lower than in the control, and does not developed in the tissue of rapidly-growing hepatomas. The specific activity of fructokinase in soluble fraction and mitochondria from slowly-growing hepatomas was slightly less than in the control. The activity of fructokinase in mitochondria of rapidly-growing hepatomas has not been noted. The specific activity of glucose-6-phosphate and 6-phosphogluconate dehydrogenases is sharply increased in soluble fraction of both slowly-growing and rapidly-growing hepatomas.

"Precipitation of Aerosol in a Medium Supersaturated With Water Vapor"

Novosibirsk, Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, No 8 (203),
Jun 72, pp 86-92

Abstract: Highly dispersed aerosols may be precipitated very effectively out of the gaseous phase by cooling the dusty gasses saturated with water vapor in a fine gage nozzle. The effectiveness of the aerosol precipitation on the condensation-diffusion filter depends on the specific quantity of the condensing moisture, velocity of the gas, the type, width and height of the condenser, nozzle channels and on the initial dust content of the gas. The laminated nozzle appears to be the most reasonable type of nozzle for the condenser. The precipitation of aerosol particles and drops in a condensation-diffusion nozzle takes place principally on account of the diffusion forces.

AS A FIRST STEP, THE REPRODUCTION MODEL DESCRIBED BY A POINT BRANCHING STOCHASTIC PROCESSES IS STUDIED. A RIGOROUS SOLUTION OF THE PROBLEM IS OBTAINED AND A NUMBER OF CONSEQUENCES ARE COMPARED WITH OBSERVATIONAL DATA. THE EXISTENCE OF NON-STATIONARITY OF SYSTEMS OF GALAXIES PROCESSING A POSITIVE TOTAL ENERGY IS NATURALLY EXPLAINED IN THE FRAMEWORK OF THE MODEL SUGGESTED. IT IS SHOWN THAT THE CALCULATED CHARACTERISTICS OF SYSTEMS OF GALAXIES SUCH AS THE RADIUS, THE DENSITY OF POPULATION, THE VELOCITY DISPERSION, QUOTA OF CROWDED DOUBLE GALAXIES AND SOME OTHERS RECONCILE WITH OBSERVATIONAL ONES.

"Laboratory Instruments for Studying the Wear Resistance of Construction Steel under the Conditions of Lubrication with Aviation Fuel"

V sb. Kontaktno-gidrodinamich. teoriya smazki i yeye prakt. primeneniye v tekhn
(Contact-Hydrodynamic Theory of Lubrication and Its Practical Application in
Engineering--collection of works), Kubyshev, 1972, pp 18-19 (from RZh-Aviatsion-
nyye i raketnyy dvigateli, otdel'nyy vypusk, No 11, Nov 72, Abstract No 11.34.88)

Translation: It is reported that in order to establish causes for the difference in aviation fuels with respect to the antiwear properties and also to study the mechanism of wear in fuel environments, laboratory instruments have been built which simulate the conditions of operation of the working members of fuel system units. The instruments permit studies to be made under a broad range of external conditions (mutual displacement rate, load, temperature). The small amount of fuel required to perform the experiment permits a study to be made of the effect of the chemical composition of the fuel on the anti-wear properties. The instruments built and a number of studies which have been made permit the development of measures to increase the service life and operating reliability of aircraft fuel system units.

ABSTRACT. THE AUTHORS DESCRIBED 10 CASES OF NEUROLEUCOSIS OCCURRING IN PATIENTS WITH VARIOUS MORPHOLOGICAL VARIANTS OF ACUTE LEUKEMIA. IN 7 CASES SYMPTOMATOLOGY OF LEUKEMIC MENINGOENCEPHALITIS TOOK PLACE, IN ONE PATIENT, AFFECTION OF CAUDA EQUINA, AND IN 2, SPINAL AFFECTION WITH THE INFERIOR PARAPLEGIA AND A DISTURBED FUNCTION OF THE PELVIC ORGANS. ALL THE PATIENTS WERE TREATED WITH INTRALUMBAL INTRODUCTION OF METHOTREXATE. THERAPY PROVED TO BE EFFECTIVE IN FRESH CASES AND AT RELATIVELY EARLY STAGES OF ACUTE LEUKEMIA. THERAPY OF NEUROLEUCOSIS RELAPSES HAS A SMALL VISTA. TREATMENT OF ACUTE LEUKEMIA AT THE TERMINAL STAGE IS COMPLETELY INEFFECTIVE.

DEVELOPMENT OF MULTIPLE DRUG RESISTANCE IN BACTERIA REPEATEDLY
TREATED WITH TETRACYCLINE

M. F. Khanina, V. V. Potapov, A. A. Terekhov

N. F. Gamaleya Institute for Epidemiology and Microbiology, Academy of Medical
Sciences of the USSR, Moscow

On passages to media containing increasing concentrations of tetracycline the strains of *E. coli* acquired higher resistance levels to tetracycline and at the same time became resistant to chloramphenicol, streptomycin, penicillin. Other properties, such as requirements in growth factors, morphology, multiplication rate also changed in most of the polyresistant mutants studied. It is supposed that decrease in sensitivity to other drugs in tetracycline resistant mutants was associated with impaired transport of substances inside the cell.

"An Installation for Durability Testing of Thermocouples"

USSR Author's Certificate No 252436, filed 6 Aug 68, published 19 Mar 70
(from RZh-Elekrotehnika i Energetika, No 10, Oct 70, Abstract No 10A164 P)

Translation: An installation is proposed for durability testing of thermocouples. The unit contains a hermetically sealed housing which accommodates two heaters for the cold and hot ends of the specimen to be tested, electrically insulated thermal junctions between the specimen and the heaters, measurement thermocouples, and probes. To increase the operational reliability of the installation, flexible heat contact plates based on steatite with the addition of 1-20 percent molybdenum are used as the electrically insulated thermal junctions.

INSTITUTE PLANS SEWAGE TREATMENT FOR VOLGA, URAL RIVER BASINS

Article by A.A. Terekhov, director, State Republic Institute for Planning and Surveying of Municipal Water Supply and

Sewer Systems, RSFSR Ministry of Municipal Water Supply and Services; "A Noble Purpose - Protection of Russia's Municipal Services,"

No 5, 1973. Party Komissariat of Russia's Rivers;

Development of water supply to populated areas and sewage

Party, and Soviet Government daily, uniting concern for the health and welfare of the people.

During the years of Soviet rule water supply and sewage treatment has transformed into a major national economic sector.

Soviet scientists and engineers have designed new systems, structures, equipment, instruments, and computational methods for water main facilities, and they have set precedents

for planning and equipment. The Directives of the 20th CPSU Congress require expansion of public services and amenities for populated centers, improvement of municipal services for populated centers, and intensification of work to prevent pollution of Volga and Ural River basins by untreated sewage. This document sets the goal of terminating

In the beginning of 1972, the USSR Council of Ministers adopted the decree "On Measures for the Environment, and the principal cities along the Volga and Ural by 1980.

"Device For Matching Of Linear Voltages With Series Operation Of Two Constant-Current Regulators"

USSR Author's Certificate No 302838, filed 28 Nov 69, published 30 June 71
(from RZh:Elektronika i yeye primeneniye, No 2, Feb 72, Abstract No 2B481P)

Translation: In the technique of remote power supply of underwater main lines of communication, power supply of successive amplifiers by constant current regulators with two routings is used. In order to match the voltage at the output of both current regulators, it is proposed to install, in parallel with the output terminals of the regulator, networks of a series-connected variable resistor, silicon stabililitrone, and a semiconductor diode, which are adjusted during tuning with the aid of the variable resistor to a specific part ($\sim 10\%$) of the current load of the regulator. With a change of voltage at the regulator output because of a difference of internal resistances, the current of the network is changed which must lead to a change of the regulator current. However, the regulator feedback circuit uses up the magnitude of the current because of such change of the internal resistance of one of the regulators during which the network current and consequently the output voltage remain unchanged. 1 ill. "Radial Magnetohydrodynamic Bearing With Floating Collar"

Riga, Magnitnaya gidrodinamika, No 1, 1973, pp 129-134

Abstract: The steady-state problem of lubricating a cylindrical magnetohydrodynamic bushing of infinite length with a freely floating collar is considered in this paper. The effect of an ideally conducting collar on the basic characteristics of the MHD bushing is investigated, with the inertial terms neglected, in the equations of motion of the lubricant, with a Reynolds number much less than unity, and in an induced magnetic field when the magnetic Reynolds number is less than unity. The lubricant is assumed incompressible, and the gaps in the bushing as well as the collar thickness are small compared to the radius of the shaft. Consideration is given to the case in which a constant difference in electrical potential is applied to the ideally conducting surfaces of the bearing and pin. It is found that an external magnetic field accelerates the rotation of the collar floating freely in the lubricated gap, that the MHD bushing and collar system is better than the bushing with neutral lubrication, and that the operation 1/2

Immunologiya. Respublikanskiy mezhvedomstvennyy sbornik (Immunology.
Republic Interdepartmental Collection), No 5, "Zdorov'ya," Kiev, 1972.

Translation: Annotation: Articles included in the collection deal with the
most pressing problems of theoretical and practical immunology, viz., mechanism
of the formation of antibodies and immunological reactivity, allergy and clinical
and experimental immunopathology, specific prophylaxis, and reactogenicity
of vaccines and postvaccinal complications. Works aimed at devising methods
of immunological investigations help to solve problems of modern immunology.

The previous four issues of this collection were published under the title of
"Voprosy Immunologii" (Problems of Immunology).

The collection is of interest to scientific workers, practitioners of various
specialties, and to senior students of medical institutes.

191 pages. 52 Russian articles with Russian abstracts.
