highly sensitive interferometric devices described in [8-10] on reproduction  
of the maximum energy of the temperature  $T_{\text{surf},\text{max},\Omega_1}^0$  on the surface of the  
sample.

For the heat-resistant superhigh frequency dielectrics used at this time,  
the noise temperature  $T_{\text{n.d.}}^0$  is a complex function of the properties of the  
material and the maximum temperature on the surface,  $T_{\text{surf},\text{max.}}^0$ . The criterion  
 $T_{\text{surf},\text{max.}}^0$  can be the thermal noise coefficient of the dielectric

$$\left| \frac{T_{\text{K.N.}}}{T_{\text{surf},\text{max.}}} \right| = \left| \frac{T_{\text{n.d.}}^0}{T_{\text{surf},\text{max.}}^0} \right| \quad (2)$$

determined experimentally.

Ocherki Razvitiya Otechestvennoy Radiatsionnoy Meditsiny (Essays on the Development of Domestic Radiation Medicine), Moscow, Meditsina, 1972, 228 pp

Translation: Annotation: The present book attempts to analyze the history of the development of radiation medicine in our country.

In order to give the reader a more complete idea of the development of medical radiology, the book includes sections on the history of the organization of radiation medicine, the training of radiology specialists, and the development of scientific research institutions.

Special attention in the monograph is devoted to questions of the medical use of various sources of ionizing emission for radiation therapy, radioisotope diagnosis, and radon therapy.

More sketchy information is given on the history of the development of radiation hygiene, occupational radiation pathology, and radiotoxicology.

The monograph is illustrated with 33 photographs. The bibliography includes 103 sources of literature.

ABSTRACT. DESCRIPTIONS ARE GIVEN OF THE DESIGN AND PERFORMANCE OF MULTICHARGED ION SOURCES. THE SOURCE WAS USED WITH CALCIUM AND ZINC METAL WITH THE VAPOR ELASTICITY REACHED AT ABOUT 800 TO 900 DEGREES C. THE MULTICHARGED CALCIUM AND ZINC IONS WERE OBTAINED WITH A SOURCE DEVELOPED FOR THE U-300 CYCLOTRON. TABULATED DATA INDICATE PULSED CURRENT VALUES FOR NINE CHARGED CALCIUM IONS AND TEN CHARGED ZINC IONS. IN SUCH A CASE THE MEAN ZINC CONSUMPTION IS SIMILAR TO 50 MG, HR AND CALCIUM CONSUMPTION IS SIMILAR TO 100 MG, HR. EXPERIMENTS ON ACCELERATION OF HEPTA CHARGED CALCIUM IONS AND DECA CHARGED ZINC ION SHOWED A MEAN CURRENT FOR CA PRIME7 POSITIVE SUB40 IONS ON THE 100 CM RADIUS REACHED 3 MU A AND AN EXTRACTED DECO CHARGED ZINC BEAM UP TO CONGRUENT TO 10 NEGATIVE PRIME4 MU A.

"Osmotic Effect at the Border Diffusion"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 47, No 1, Jan 73, pp 145-149

Abstract: A model of boundary diffusion was developed with consideration of the formation of an effect analogous to the osmotic one. As a result, formation of dislocations takes place in the boundary zones which accelerates the diffusion inside the grain and with its motion carrying the atoms of the admixture. A self-adjusted system of equations was derived which describes the process under analysis.

BEKSHAYEV, Ya. A., VOROB'YEV, Yu. L.

"Determination of Forces and Moments Acting on Vessels Sailing Parallel Courses"

Sudostr. i Sudoremont. Nauch.-tekhn. sb. [Shipbuilding and Repair, Scientific and Technical Collection], No 4, 1970, pp 20-29, (Translated from Referativnyy Zhurnal, Mekhanika, No 4, 1972, Abstract No 4 B411 by A. K. Nikitin).

Translation: The linear problem of the stable motion of two ships in parallel courses at speed  $v_0$  in deep water is studied. The velocity potential in inverted motion is represented as

$$\Phi(x, y, z) = -p_0 x + \phi_1 + \phi_2 + \phi_0$$

where  $\phi_1$  is the velocity potential resulting from the motion of ship 1 without ship 2;  $\phi_2$  is the velocity potential resulting from the motion of ship 2 without ship 1;  $\phi_0$  is the velocity potential resulting from the interaction of the ships. Potentials  $\phi_1$  and  $\phi_2$  are known;  $\phi_0$  is determined from the LaPlace equation and boundary conditions on the free surface, on the surface of the ships

1/3

and at infinity. Transverse forces and moments acting on the ships are determined by the method of acceleration potential on the basis of the change in acceleration potential

$$\theta - \theta_0 = \frac{p - p_0}{\rho} = -\gamma(\xi, \zeta) v,$$

Integral equations are produced for determination of intensities  $\gamma_1$  and  $\gamma_2$ . The authors study the limiting case, when parameter  $v = g/v_0^2 \rightarrow \infty$  (low speeds of motion of ships). The integral equations in this case are simplified and reduced to a system of two linear singular equations, which is solved by successive approximations by inversion of a Cauchy-type integral for functions not limited at the ends of the interval. Then, the forces and moments are found for each approximation. The process of successive approximations is considered completed if

$|P_y^{(n)} - P_y^{(n-1)}| \leq \epsilon_1, |M_y^{(n)} - M_y^{(n-1)}| \leq \epsilon_2$

where  $P_y^{(n)}$ ,  $M_y^{(n)}$  are the transverse force and yaw moment in the n-th approximation on the ship in question, while  $\epsilon_1$  and  $\epsilon_2$  are the accuracies of calculation of the forces and moment used. It is demonstrated that a solution can produce similarly for the case of high speeds of motion of the ships ( $v \neq 0$ ).

"Design of Turbine Machine Blades for Forced Oscillations with Various Types of Excitation"

Kiev, Problemy Prochnosti, No 11, Nov 72, pp 15-19.

**Abstract:** The problem of forced oscillations of the working blades of turbine machines is solved by a variation method based on the refined theory of oscillations of twisted rods considering the influence of internal inelastic resistance and aerodynamic damping. Forms of oscillations are determined, as well as the distribution of internal forces, moments and stresses over the length of the blade under the influence of loads with arbitrary rule of change with time and over the length of the blade.

"Investigation of Birefringence at Piezoresonance in GaAs Crystals"

Moscow, Raditekhnika i Elektronika, Vol 17, No 11, Nov 72, pp 2349-2353

**Abstract:** An alternating electric field was used to excite piezoresonance in gallium arsenide crystals placed between two polaroids. The light flux passing through the crystal and polaroids was found to be modulated by a frequency equal to that of the mechanical oscillations, or else double or quadruple this vibration frequency, depending on the amplitude of the oscillations and the mutual orientation of the polaroids. The results are analyzed on the basis of present concepts concerning the linear electro-optical effect and photoelasticity. The distribution of elastic stresses in the crystal is found for various excitation frequencies. The ratio between primary and secondary electro-optical effects in gallium arsenide is determined. The Q of the piezoelectric resonator is measured with respect to the percentage modulation of the oscillations excited by the resonance frequency field modulated by a low frequency signal. It is shown that modulation of the light beam passing through the crystal is due to nonhomogeneity of the specimen.

"On the Application of the Ranging Radar 'Luch'"

Moscow, Geodeziya i Kartografiya, No. 9, 1971, pp 24-31

**Abstract :** The experience is described in the use of the ranging radar "Luch" by laying out of polygonometric traverses of 1st and 2nd classes and trilaterization of the 2nd class in the tundra beyond the polar circle at the average summer temperature of +9°, in the year 1970. Measurement results are presented in tables and are discussed by reference to diagrams. Recommendations are given for increasing the efficiency of the ranging radar. It is concluded that with the radar Luch geodetic works can be performed reliably and easily with the accuracy required for 1st class works. The measuring accuracy of the ranging radar Luch excels that of other domestic ranging radars in the inter-

"The Effect of Trace Element Composition of the Diet on the Activity of Some  
Bone Tissue Enzymes in Experimental Animals"

Moscow, Voprosy Pitaniya, No 2, 1970, pp 57-61

**Abstract:** In a chronic experiment involving 63 white rats, the addition of copper (0.018 mg/100 g of body weight/24 hours) to the diet inhibited alkaline phosphatase activity while stimulating cytochrome oxidase activity. Manganese (0.06 mg/100 g) activated both alkaline phosphatase and cytochromoxidase. Zinc (0.0108 mg/100 g) stimulated alkaline phosphatase activity while inhibiting cytochromeoxidase activity. Exclusion from the diet of one of the trace elements, and especially all three, made the animals sluggish, caused skin disorders, and affected the weight. Weight gains resulted from the exclusion of either copper, manganese, or zinc, but losses (6.8 g on the average) resulted when all three elements were eliminated. It was concluded that the activity of bone tissue enzymes is dependent not only on the absolute content of trace elements, but on their relationships in the diet.

"Temperature-Velocity Relationship of Metal Resistance to Plastic Deformation"  
Moscow, Stal', No 12, Dec 73, pp 1108-1109

**Abstract:** The advantage of using orthogonal rotation planes of an experiment for the mathematical description (and study) of the temperature-velocity relationship of metal resistance to plastic deformation is shown. The deformation relationship itself is a function of three independent variables: temperature-( $t$ ), magnitude ( $\epsilon$ ) and velocity ( $\dot{\epsilon}$ ), and has the form  $\ln \sigma' = \varphi(\ln \dot{\epsilon}, \ln \epsilon, t)$ . An empirical formula was derived from this relationship for determining the deformation resistance and has the general form:

$\sigma' = A \dot{\epsilon}^a \epsilon^b e^{-ct}$ . Values of  $A$ ,  $a$ ,  $b$ , and  $c$  are given for 21 steels, 3 heat-resistant alloys, and white cast iron. Three tables, six bibliographic references.

"Tendency of Type 40Kh Steel from Various Melts to Brittle Rupture"

Problemy Prochnosti, No 11, 1971, pp 101-105.

**ABSTRACT:** The influence of the method of deoxidation of Type 40Kh fine-grained steel on its brittle rupture tendency is studied. Tests are performed using impact specimens with a fatigue crack. The value of  $a_3$  [the work expended in the growth of an existing crack to critical size] and a [remaining component of impact toughness] are determined. Throughout the entire interval of below-freezing temperatures, the value of  $a_3$  is significantly (3-4 times) higher for heat-treated steel produced by siliconless deoxidation.

"The Effect of Super Low Temperature (-195°C) on the Pollen of Various Plants"

Moscow, Doklady Vsesoyuznoy Ordona Lenina Akademii Sel'skokhozyaystvennykh Nauk imeni V. I. Lenin, No 5, 1970, pp 2-6

**Abstract:** Experiments were conducted with pollen of various ages carefully gathered from tomatoes, potatoes, cucumbers, onions, beets, sorrel, peas, cabbage, radishes and birches, and subjected to cryogenic temperatures (-195°C) with liquid nitrogen, for periods from one minute to a month. It was found that all specimens of pollen were more viable than controls. The fertilization rate was higher than in controls, the setting of fruit was good, the fruit was of good quality and seeds were better. In addition, cross pollination was effective. Old, inactive or dead pollen was stimulated by instantaneous freezing at cryogenic temperatures; it became active, and fertilized plants with resulting high-quality fruit. The stimulating effect of the temperature of liquid nitrogen (-195°C) was evident to a remarkable degree in all the specimens of pollen under investigation.

"Experimental Study of the Efficiency of Escapement Mechanisms"

Tr. NII Chas. Prom-sti. [Works of Scientific Research Institute of the Clock Industry], 1971, No 8, pp 89-96, (Translated from Referativnyy Zhurnal, Metrologiya i Izmeritel'naya Tekhnika, 1972, No 5, Abstract No 5.32.584).

Translation: A method and results are described from a study of the efficiency of 42 millimeter (stopwatch) and 26 millimeter (wristwatch) escapement mechanisms. The nature and influence of efficiency are studied with changes in such factors as moment of inertia of the balance wheel, rigidity of the hairspring, oscillating period, as well as the influence of a change in the oscillating amplitude resulting from a change in the drive torque and design factors (number of teeth of the escapement wheel, type of escapement) on escapement efficiency. A brief analysis is presented of the nature of the dependence of escapement efficiency on various types of energy losses in the escapement mechanism.

Moscow, Problemy Gematologii i Perelivaniya Krovi, Vol 16, No 8, 1971,  
pp 3-7

Abstract: Erythrocytes were obtained after separation of plasma from donor  
blood which had been kept in storage for 24 hours, washed with physiological  
solution, and examined by the electron microscope method; unwashed erythro-  
cytes from the same blood served as controls. After two washings the  
submicroscopic organization of cells in the washed erythrocytes did not  
differ essentially from that in the unwashed erythrocytes. The conclusion  
1/2

was that washing the erythrocytes from blood prepared with a glucose-citrate preservative and stored for one day has no significant effect on the ultrastructure of almost the entire mass. Investigation of phosphorus fractions demonstrated the metabolic integrity of the washed erythrocytes through one or two washings. Thus, washing with physiological saline solution does not alter the structural completeness, metabolic activity, or biological value of erythrocytes. None of their indexes differ from those of erythrocytes of whole blood stored for 1 day and used for extracorporeal circulation in cardiac surgery; they should therefore be recommended as the basic component in perfusates for extracorporeal circulation.

CIRC ACCESSION NO--AP0132583  
ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE EFFECT OF CATECHOLAMINES ON SODIUM REABSORPTION HAS BEEN STUDIED IN HENS AND FROGS (ANA TEMPORARIA). THEIR RENAL TUBULI ARE SUPPLIED BY BLOOD VIA TWO SYSTEMS OF CIRCULATION: THE ARTERIAL AND RENAL PORTAL ONES. THIS FACT ENABLES TO CREATE HIGHER CONCENTRATION OF AGENTS IN PERITUBULAR CAPILLARIES AT THE SIDE OF INJECTION AS COMPARED TO RENAL GLOMERULI. INJECTIONS OF THE ADRENALINE (0.1-5 MUG PER KG) IN HENS INTO RENAL PORTAL VEIN (VIA FEMORAL VEIN) DECREASED THE EXCRETED FRACTION OF SODIUM IN ABSENCE OF A SIGNIFICANT EFFECT UPON THE GLOMERULAR FILTRATION RATE. THIS EFFECT WAS BILATERAL AND ATTAINED ITS MAXIMUM EFFICIENCY 20-40 MIN. AFTER INJECTION. TREATMENT BY TOLAZOLIN (AN ADRENOLYTIC BLOCKING VASCULAR REACTION TO ADRENALINE) DOES NOT PREVENT STIMULATION OF SODIUM REABSORPTION. IN FROGS, BOTH THE ADRENALINE AND NORADRENALINE (1 MUG PER KG BODY WEIGHT) SIGNIFICANTLY DECREASED THE DIURESES AND FILTRATION, BUT DID NOT SIGNIFICANTLY AFFECT SODIUM REABSORPTION. THE DATA OBTAINED SUGGEST THAT STIMULATORY EFFECT OF THE ADRENALINE ON SODIUM REABSORPTION IS NOT ASSOCIATED WITH CHANGES IN HAEMODYNAMICS, BUT RESULTS FROM THE INFLUENCE OF THE ADRENALINE ON THE METABOLISM OF TUBULAR CELLS.

"Basicity of Tertiary Arsine Oxides and the Kinetics of Their Reactions With Alkyl Halides"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 9, Sep 73, pp 1939-1943

**Abstract:** Thermodynamic basicity constants of five tri-n-alkylarsine oxides in water were determined. It was shown that in this case the size of the hydrocarbon radical has no effect on  $pK_T$ . It was found that the reaction of tri-n-alkylarsine oxides with butyl iodide is of a general second degree order, but first degree order in respect to the trialkylarsine oxide. The relationship of the reaction rates of trialkylarsine oxides and the structures of alkyl halide is analogous to that of the  $S_N2$  reactions.

Between Tertiary Arsine Oxides and Alkyl Halides"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 3, 1972,  
pp 695-697

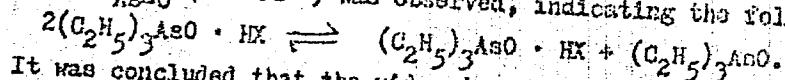

Abstract: The IR spectra of  $\left[ R_3AsO \right]_2^{2-}X^-$  do not distinguish between the  
forms  $R_3 - As - O - As^+R_3$  (form A) and  $\left[ R_3As \rightarrow O \cdots H^+ \cdots O \leftarrow AsR_3 \right]$

(form B). We attempted to elucidate the correlation between the structure of  
these compounds and their IR spectra, using the systems  $\left[ (CH_3)_3AsO \right]_2^{2-}X^-$   
(compound I),  $\left[ (C_2H_5)_3AsO \right]_2^{2-}X^-$ , for X = I (compound IIa), X = Br (compound  
IIb), and X = Cl (compound IIc);  $\left[ (C_3H_7)_3AsO \right]_2^{2-}HI$  (compound III); and  
 $1/2$

$\left[\text{Ph}_3\text{AsO}\right]_2\text{HX}$ , for X = Br (compound IVa) and X = Cl (compound IVb). Wide intense diffuse absorption bands between 550 and 1800  $\text{cm}^{-1}$  are characteristic of these systems. The difference between forms A and B is that in A, proton interaction is possible between the oxygen and the halogen but in B, it is between two oxygen atoms. In spectra made using chloroform and acetophenone the  $\nu_{\text{As=O}}$  ( $880 \text{ cm}^{-1}$ ) was observed, indicating the following dissociation

It was concluded that the wide adsorption in the area  $750 - 1800 \text{ cm}^{-1}$  approximately divided into three bands, may be attributed to absorption by the OH group, participating in a strong symmetrical bond.

"Technical and Economic Indicators of Plasma Arc Remelting"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promyshlennost', No  
6, Nov-Dec 73, pp 62-64

**Abstract:** This article presents the results of studies of the technical and economic indicators of plasma arc remelting. The studies were performed at the Moscow Institute of Engineering and Economics on the basis of plant report data. The studies showed that the present level of these indicators does not correspond to the actual capabilities of the process. Where production facilities are fully mastered and normal operation of the equipment is achieved, the level of utilization of calendar time reaches 89.5%. The normal level of cost of the process is 108.8 rubles per ton, the specific capital investment required per unit of capacity is 220 rubles per ton. The indicators show that plasma arc remelting is equal in these respects to vacuum arc and cathode ready remelting.

Translation: One important element in the software system of an ACS is the set of standard procedures for machine processing of information in all stages of performance of the task. This article describes a library of procedures for processing of files of economic information. This library is written for the ASVT computer and has been tested in a number of typical control-system problems. The experience in application of similar sets of programs shows the sufficient completeness of the set of standard procedures for solution of common ACS problems, as well as the effectiveness of automation of programming using standard program libraries.

"Chlorophyll Synthesis and Formation of Chloroplasts in Greening Normal and Mutant Maize Leaves"

Moscow, Molekulyarnaya Biologiya, Vol 5, No 3, May/Jun 71, pp 366-374

Abstract: The correlation between fluorescence spectra, quantity of chlorophyll pigments, and development of chloroplasts was studied in normal and carotenoid mutant maize leaves during the greening process at low intensity light (25 lux). In the fluorescence spectra of normal and mutant leaves recorded at low temperature ( $77^{\circ}\text{K}$ ), a maximum at 635 millimicrons corresponds to protochlorophyll; at 655 -- to protochlorophyllide; at 672 -- to chlorophyll; and at 686 -- to chlorophyllide. Exposure to light results in a fast photoconversion of protochlorophyllide and protochlorophyll in etiolated leaves, while no such conversion takes place in normal leaves. In the mutants, photolysis of chlorophyllide begins in earlier stages of greening and proceeds at a faster rate than in normal maize plants. Investigation of the chloroplast structure in different stages of the greening process revealed the presence of prolamellar

1/2

USSR

LANG, F., et al, Molekulyarnaya Biologiya, Vol 5, No 3, May/Jun 71, pp 366-374  
bodies in the proplastids of both the etiolated normal and mutant leaves.  
After 3-6 hours of illumination, circular lamellar systems are formed in normal  
and mutant plastids. After a 24-hour exposure to light, granules are formed in  
normal but not in mutant chloroplasts. After prolonged illumination, mutant  
chloroplasts also form granules, though of a different structure. Mutant  
chloroplasts are highly heterogenic. No correlation was found between chloro-  
phyll synthesis and formation of chloroplast structures in greening leaves ex-  
posed to low intensity light even though, according to other investigators, such  
correlation exists during exposure to high intensity light.

"Corrosion Resistance of Vanadium and Its Titanium Alloys in a 3% NaCl  
Solution"

Moscow, Zashchita Metallov, Vol 7, No 6, Nov-Dec 71, pp 699-700

Abstract: The corrosion resistance and mechanical properties of Va alloyed with 5-20% Ti were investigated. Ingots weighing 10-12 kg, smelted in an electric furnace, were forged and rolled to 2 mm- and 0.3-mm-thick sheets. An increased Ti-content increased the corrosion resistance in a naturally aerated solution. The corrosion rate of the alloy with 5 % Ti is considerably lower than 0.001 mm/year, which is the standard limit of ideal corrosion resistance of metals. Electro-HCl-solution revealed that Va and its alloys with Ti are not passivated at potentials of 0.05 -0.7 v relative to a normal hydrogen electrode, but with increasing Ti-content a decrease of the anodic current takes place. According to measurements of stationary electrode potentials, a refining of potentials of Va and its alloys takes place in time. One illustr., one table.

"Combined Effect of Alloying and High-Temperature Thermomechanical  
Treatment on the Resistance of Low-Tempered Martensite to Brittle Failure"  
Moscow, Izvestiya Akademii Nauk SSSR, Metallo, no 6, Nov-Dec 70, pp 124-127

Abstract: This study involved arc furnace-melted steels 40, 40Kh, 40KhS,  
40KhM, and 40KhSMF. The steels were quenched from 870°C (heating in a  
salt bath for 6 minutes, oil). The high-temperature thermomechanical treat-  
ment (HTTMT) was effected by rolling in shaped rolls at 900°C with deforma-  
tion of about 50%. The tempering temperature was such as to insure a  
tensile strength of 190-215 kg/mm<sup>2</sup>. HTTMT is shown to increase the  
resistance of low-tempered steels (varying in degree of alloying) to  
brittle failure; it was also found to level off the differences in notch  
and crack sensitivity. HTTMT increases the crack-propagation resistance

of low-tempered martensite through changes in the macrostructure of the  
fracture. The tangible differences in the values of the pair coefficients  
of correlation between the notch sensitivity characteristics demonstrate  
that the latter are not interchangeable in evaluating the resistance of  
low-tempered martensite to brittle failure.

"The Toxicological Characteristics of the New Pesticide Antio"

Moscow, Farmakologiya i Toksikologiya, Vol 36, No 1, Jan-Feb 73, pp 104-107

**Abstract:** Antio [ $O,O$ -dimethyl S-(N-methyl,N-formylcarbamoylmethyl) dithiophosphate] is an effective insecticide and acaricide for the treatment of fruit, vegetable, citrus, and other crops. Its toxicity to warm-blooded animals was investigated. LD<sub>100</sub> was 125, 500, and 400; LD<sub>50</sub>, 83.3 ± 10.3, 218 ± 75.4, and 310 ± 41; and the threshold dose producing inhibition of the cholinesterase activity in the blood 5, 10, and 15 mg/kg for mice, male rats, and cats, respectively. The toxicity of Antio varied with the sex of the animals: LD<sub>50</sub> was 635 ± 38 mg/kg for female rats vs. 218 ± 75.4 for male rats. The compound exerted a slight cumulative action. On repeated peroral administration, Antio produced, in addition to an inhibition of cholinesterase activity, disturbances in the functioning of the liver and morphological changes in this and other organs. Its threshold daily dose on peroral administration to rats was 0.38 mg/kg.

TRANSMISSION PATHWAYS FOR DUODENAL RECEPTORS ON THE MOTRICITY  
OF THE LARGE BOWEL

Vorob'yeva, N.M.

Institute of Nutrition Hygiene, Institute of Physiology of the State University of Kiev

In chronic experiments on 4 dogs with duodenal fistulae and fistula of the large bowel the author studied the pathways of transmission from the receptors of the duodenum onto the motricity of the large bowel. Vagus, splanchnic and pelvic nerves were sectioned, as well as the bowel at the level of the ileocoecal sphincter. Data suggest that the influences from the mechanoreceptors and chemoreceptors of the duodenum on the motricity of the large bowel is realized through the external nerves of the gastro-intestinal tract (splanchnic, vagus and pelvic nerves) and through the intramural mechanism in the intestinal walls.

"The Role of a Plasma Torch in the Energy Balance of the Process of the Action of Laser Emission on Materials"

V sb. Kvant. elektronika (Quantum Electronics -- Collection of Works), No 2(14), Moscow, "Sov. Radio," 1973, pp 77-80 (English summary) (from RZh-Fizika, No 10, Oct 73, Abstract No 10D899 from authors' abstract)

Translation: The authors measured the energy reemitted by a plasma torch in a wide spectral interval (0.2-4 microns) during the action of laser emission on opaque obstructions. The power density of the incident beam was  $\sim 10^6$  and  $\sim 10^7$  w/sq cm with retention of the size of the spot on the target. The targets used were duralumin, ebonite, and graphite. It is shown that the energy reemitted by the plasma torch is from 20 to 50 percent of the energy of the laser beam, depending on the material and exposure conditions. The resultant experimental data are used as the basis for evaluating the role of other factors in the energy balance of the action of laser emission on materials. Bibliography with six titles.

"Isolation of Omsk Hemorrhagic Fever Virus From Cold-Blooded Animals in a Natural Focus"

Novosibirsk, Izvestiya Sibirsogo Otdeleniya Akademii Nauk SSSR, Seriya Biologicheskikh Nauk, No 10 (190), 1971, pp 180-182

**Abstract:** Five strains of Omsk hemorrhagic fever (OHF) virus (1317, 1247, 1150, 1243, 1242) were isolated from the brains, hearts, and livers of frogs and lizards dwelling in a natural focus of the disease (Karasuk Rayon, Novosibirsk Oblast, Western Siberia), an indication that these animals can be spontaneous virus carriers. All the strains were identified by serological tests and the fluorescent antibody method. The symptoms of the disease observed in mice infected with the strains isolated from the frogs and lizards were the same as those in mice infected with OHF virus isolated from other sources. Peripheral injection of frogs with the virus and its subsequent detection in various organs testified to the presence of viremia and susceptibility of the animals to OHF virus.

"Ecological Relationships of the Virus of Omsk Hemorrhagic Fever with Animals in  
a Natural Focus"

Novosibirsk, Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, Seriya Bio-  
gicheskikh Nauk, Vol 1, No 5, Apr 70, pp 98-102

**Abstract:** Circulation of hemorrhagic fever virus among various types of animals  
-- inhabitants of a natural focus -- the emergence of ecological links between  
virus and animals, and elucidation of a possible nontransmitting mechanism for  
transfer of the infection in the natural focus were the aim of this study. A  
total of 890 small mammals of 13 species from seven regions in the Novosibirsk  
area were examined. The blood of 705 small mammals of 13 species and the serum  
of 1199 domestic animals were tested in the hemagglutination inhibition test with  
antigen from regional strains of Omsk hemorrhagic fever virus. Brain, blood,  
urine, and internal organs of the animals were examined. The virus was isolated  
on chick embryo fibroblasts, with subsequent intracerebral infection of white  
mice.

USSR

VOROB'YEVA, N. N., et al, Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, Seriya Biologicheskikh Nauk, Vol. 1, No 5, Apr 70, pp 98-102

To elucidate the possibilities of a nontransmitting mechanism for transfer of the infection, 56 muskrats were infected with the virus in different ways. Sixteen virus strains were isolated from muskrat brains, which indicates that the disease is of viral etiology also in the Novosibirsk region. Serological evidence established the presence of specific antibodies against hemorrhagic fever virus in the blood of domestic animals and in 10 species of small mammals. Ecological relationships exist between the virus and both wild and domestic animals in natural foci. Tests involving infection of muskrats and water rats with different doses of the virus, administered by the alimentary and inhalation routes, showed that the muskrat is very sensitive to the virus, and that water rats have a low sensitivity. Muskrats may contaminate their environment with the virus by excretion.

"On the Resistance of  $\text{Al}_2\text{O}_3$  Coatings on Nickel, Molybdenum, and Titanium in  
Melted LiCl-KCl Eutectic"

Moscow, Zashchita Metallov, Vol 19, No 2, Mar-Apr 73, pp 195-196

**Abstract:** The corrosion resistance in melted LiCl-KCl eutectic of  $\text{Al}_2\text{O}_3$  coatings (200  $\mu$ m thick, 12-15% porosity), applied in argon on wire specimens of Ni, Mo, and Ti, was investigated. In comparison with unprotected Ni-, Mo-, and Ti-specimens, the coating decreased the corrosion by 2.3-2.4 times at  $400^\circ$  and by more than 3-6 times at  $500^\circ$ ; at the same time, aluminum oxide dissolved at rates of  $8.0 \cdot 10^{-5}$  and  $1.3 \cdot 10^{-4}$  g/cm<sup>2</sup> hr, respectively. The unprotected Ni-specimens corroded at  $400^\circ$  at the rate of  $3.6 \cdot 10^{-4}$  and at  $500^\circ$  at the rate of  $3.6 \cdot 10^{-3}$  g/cm<sup>2</sup> hr. The corresponding values for Mo are  $5.4 \cdot 10^{-4}$  and  $7.7 \cdot 10^{-4}$  and  $4.6 \cdot 10^{-4}$  and  $9.2 \cdot 10^{-4}$  g/cm<sup>2</sup> hr for Ti. The aluminum oxide coating on Ti proved to be non-resistant. Plasma oxide coatings can be applied to protect metals against corrosion under conditions of melted salts. A further increase of corrosion resistance would probably result by increasing the plasma flux temperature and by decreasing the coating porosity.

Tick-Borne Encephalitis"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 42, No 1,  
Jan/Feb 73, pp 28-32

**Abstract:** An evaluation of the danger of human infection with tick-borne encephalitis in territorial subdivisions of the Amur region differing with respect to natural characteristics has been carried out on the basis of a number of factors, principally the local density of Ixodid ticks. The index of probability of infection (a product of the ratio of persons who have visited forests by the ratio of those who observed the attachment of ticks by the ratio of ticks infected with the virus of the disease) based on data collected in 1969-71 was used as a criterion. Regions with a high incidence of the disease were located in the zone of coniferous-wide-leaved forests, those with a moderate incidence in the subzone of the southern tayga and in agriculturally developed areas in the zone of coniferous-wide-leaved forests, and those with 1/2

Moscow, Zhurnal Vysshoy Nervnoy Deyatel'nosti imeni I. N. Pavlova, Vol 22,  
No 3, May/Jun 72, pp 557-563

**Abstract:** To resolve the question of whether the hypothalamus of rats has an independent "center of pleasure," various nuclei and paths connecting the hypothalamus with other structures were consecutively destroyed through electrolytic coagulation by implanted electrodes, and the frequency and pattern of dorsal hypothalamic self-stimulation were recorded. The results indicate that the "center of pleasure" functions as a relatively independent mechanism which is controlled by two systems. The reticular formation of the mesencephalon, the central gray matter around the aqueduct of Sylvius, anterior thalamic nuclei, dorsal portions of the septo-fornical system, and the hippocampus form the activating system, while ventral portions of the septo-fornical system, dorsomedial thalamic nuclei, amygdala, and parts of the hippocampus form the inactivating system. The septo-hippocampal structures constitute the final common path for positive emotions.

"Ultrastructural Changes in Nerve Cells Induced by Hypoxia"

Moscow, Zhurnal Nevropatologii i Psichiatrii, No 12, 1972, pp 1819-1827

**Abstract:** Optical microscopic examination of cortical neurons in rats exposed to hypoxia for varying periods revealed a great variety of morphological changes ranging from physiological activation to ischemia, karyocytolysis, and disappearance of whole groups of cells. Electron microscopy showed four types of ultrastructural changes, the severity varying with the duration of hypoxia: (a) presence of "dark" osmophilic cells with increased electron density of the cytoplasm; (b) presence of cells with an increased number of lysosomes and dark osmophilic granules; (c) various changes in the mitochondria; (d) changes typical of retrograde degeneration, i.e., shifting of the nucleus to the periphery, decrease in number of elements of granular reticulum, swollen mitochondria lacking in cristae. The associated biochemical changes were marked chiefly by the decreased activity of the oxidation enzymes. The data are analyzed from the standpoint of the mechanisms of the destructive and compensatory processes in the cerebral cortex during hypoxia.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN EXPERIMENTS ON DOGS WITH A CHRONIC FISTULA OF THE PANCREATIC DUCT THE AUTHORS DEMONSTRATE THAT CASEIN HYDROLYSATE, OBTAINED BY ACID HYDROLYSIS, UPON ADMINISTRATION INTO THE BLOOD IS ENDOWED WITH A SHARPLY PRONOUNCED CAPACITY TO STIMULATE THE SECRETION OF THE PANCREATIC JUICE. THE SECRETED JUICE IS CHARACTERIZED BY A RELATIVELY LOW CONTENT OF ENZYMES AND TOTAL PROTEIN. A PREPARATION DERIVED BY MEANS OF ENZYMATIC HYDROLYSIS POSSESSES THIS CAPACITY TO A SIGNIFICANTLY LESSER DEGREE. FIBRIN HYDROLYSATE AND A NUMBER OF OTHER HYDROLYSATES OBTAINED FROM THE BLOOD DO NOT CAUSE AN INTENSIVE SECRETION OF THE PANCREATIC JUICE. AN OPINION IS SET FORTH THAT CASEIN HYDROLYSATE CONTAINS SOME FRAGMENTS OF ITS MOLECULE, WHICH IN THE ORGANISM ARE CONVERTED INTO PEPTIDE WITH SECRETIN LIKE ACTIVITY.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE PAPER DEALS WITH MORPHOLOGICAL STUDIES OF THE SYNAPSARCHITECTONICS OF THE 17 AND 18 FIELDS OF THE OCCIPITAL ZONE. THE STUDY WAS CONVENED ON THE BRAINS OF ADULT WHITE RATS. BY MEANS OF ELECTRONMICROSCOPICAL METHODS THE AUTHOR HAS DEMONSTRATED THE DISTRIBUTION OF THE SYNAPSES IN THE BRAIN LAYERS, THE DIFFERENCES IN THEIR DENSITY AND SYNAPTICAL SETS. IT WAS ESTABLISHED THAT CONTACT INTERRELATIONSHIPS OF NEURONS AND THE MORPHOLOGY OF SYNAPSES BECOME MORE COMPLICATED AS THEY LEAD TO THE LOWER LYING BRAIN AREAS. THE SYNAPSES OF THE IV AND V LAYER, BESIDES THE QUANTITATIVE PREVALENCE, POSSESS EXPRESSED ELEMENTS OF THE SUBMICROSCOPIC STRUCTURE. THEY HAVE A MORE AMOUNT OF MITOCHONDRIA IN THE SYNAPTICAL TERMINALS AND A LONGER EXTENT OF CONTACTING MEMBRANES. THE ABUNDANCE AND DIVERSITY OF INTRANEURONAL CONTACTS IN THE IV AND V LAYER ALLOW TO ASSUME A HIGH PHYSIOLOGICAL ACTIVITY AND DIVERSITY OF PROCESSES PROCEEDING IN THIS AREA.

"Electrical Conducting Metalceramic For Cathode Heaters With Heating By Passage Of Current"

Elektron. tekhnika. Nauchno-tekhn. ob. Materialy (Electronic Technology. Scientific-Technical Collection. Materials), 1970, Issue 3, p 121 (from RZh--Elaktronika i elektronika, No 1, January 1971, Abstract No 1A72)

Translation: An analysis of the temperature dependences of the electrical resistivity of cermets of various compositions showed that the difference of the character of a cermet with heating by passage of currents and with heating by an exterior source of heat is due to the microlocalized superheating of the cermet at the point of contact of the metal particles, one with another. The contact phenomena in the metalceramic leads to a reduction of the working temperature of the cermet heaters. In order to increase it, it is recommended that a cermet be used with a comparatively small electrical resistivity and refractory metal components. G.B.

"A Filter for Suppressing Spurious Emissions of High-Power Amplifier Klystrons"

Elektron. tekhnika. Nauch.-tekhn. sb. Elektron. SVCh (Electronic Technology. Scientific and Technical Collection. SHF Electronics), 1971, vyp. 3, pp 136-137 (from RZh-Radiotekhnika, No 7, Jul 71, Abstract No 7B154)

Translation: The paper describes a waveguide filter for suppressing spurious emissions from high-power amplifier klystrons with a passband of two percent. Attenuation of the power of spurious emissions is 30 dB or more throughout the entire range of operation of the waveguide. Klystron power losses in the filter on the average frequency of the working band come to one percent. Four illustrations, bibliography of one title. Resumé.

"Synthesis and Pharmacological Study of the Derivatives of 3-Hydroxy- and 3-Aminoquinuclidines"

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 7, No 8, Aug 73, pp 20-24

**Abstract:** A series of substituted quinuclidines was synthesized. To obtain 3-(2'-hydroxybenzoyloxy)quinuclidine and related ethers, the 3-hydroxyquinuclidine was reacted with benzoic acid chlorides in pyridine at 20° or 100°. 3-Acylaminoquinuclidines were synthesized by reacting 3-aminoquinuclidine with respective acid chlorides. Two methods were used to prepare 3-alkyl- and 3-aryl-aminoquinuclidines: reduction of the 3-acylaminoquinuclidine with LiAlH<sub>4</sub>, and reductive alkylation of 3-aminoquinuclidines with various carbonyl compounds, or of the respective amines with 3-ketoquinuclidine. The pharmacological studies were carried out using 3-benzoyloxyquinuclidine hydrochloride as the standard.

"Comparative Evaluation of an Alcohol-Ether Toxoplasma Antigen With Sera From Various Animals"

Alma-Ata, Izvestiya Akademii Nauk Kazakhskoy SSR, No 5, 1971, pp 39-41

Abstract: A Toxoplasma diagnostic agent made by the alcohol-ether method was much more active than a preparation obtained by deep freezing followed by lyophilization. It was 7.6 times more sensitive in the complement-fixation reaction with sera from 813 persons suspected of having toxoplasmosis, and 1.8 times more sensitive with sera from 467 laboratory animals. Spontaneous carriers of Toxoplasma among clinically healthy laboratory animals were detected 2.6 times more often with the alcohol-ether antigen than with the lyophilized antigen. The differences were even sharper when used with sera from farm and small domestic animals whose blood usually contains antibodies in low titers. The alcohol-ether antigen was found to be highly specific in extensive clinical and experimental material with sera containing both homologous and heterologous antibodies.

ABSTRACT/EXTRACT—(U) GP-0- ABSTRACT. SELECTIVE ADSORPTION OF CHLOROTETRACYCLINE BY IONITE IS DETERMINED BY INCREASE IN THE ENTROPY OF THE SYSTEM. DURING ADSORPTION OF THE IONS OF THIS ANTIBIOTIC THE ION EXCHANGE CONSTANT INCREASES WITH INCREASING TEMPERATURE AND THE SWELLING COEFFICIENT OF THE SORBENT. THIS CAN BE PROBABLY ACCOUNTED FOR BY THE LOW ENERGY OF ADDITIONAL INTERACTION OF CHLOROTETRACYCLINE WITH THE SORBENT. . . . . FACILITY: KHMIMO-FARMAEVTICHESKIY INSTITUT, LENINGRAD.

ABSTRACT/EXTRACT--(U) SP-0- ABSTRACT. A DISTILLATE (B. 244-340DEGREES, CONGEALING AT PLUS 40DEGREES, AND 27.68PERCENT YIELD OF COMPLEX FORMERS WITH UREA) WAS OBTAINED FROM A CON. UNIT DISTG. OZEK SUATSK CRUDE OIL. IT WAS DEPARAFFINATED WITH RECRYSTD. AND SPENT UREA BY USING 4 WT. PERCENT ETOH AS ACTIVATOR. SOLVENT NAPHTHA (B. 80-120DEGREES) (100 VOL. PERCENT) WAS USED TO OIL. THE TEMP. OF TREATMENT VARIED FROM NEGATIVE 8 TO NEGATIVE 19DEGREES. AFTER MIXING FOR 30 MIN, THE COMPLEX WAS VACUUM FILTERED, WASHED FREE FROM OIL WITH NAPHTHA, DRIED, AND THEN DECOMPD. BY ETOH AT 70-50DEGREES. THE UREA DISSOLVED IN THE ETOH AND RECRYSTD. WHEN THE SOLN. WAS COOLED, THE PARAFFINS COLLECTED ON THE SURFACE WERE WASHED WITH H SUB2 O, DRIED, AND ANALYZED. THE FILTRATE CONTG. THE DEPARAFFINATED FUEL WAS WASHED WITH H SUB2 O TO REMOVE RESIDUAL UREA AND ETOH. WITH MULTIPLE USE (1-5) OF THE SAME UREA, THE YIELD OF DEPARAFFINATED FUEL INCREASED FROM 72 TO 87PERCENT, THE YIELD OF PARAFFINS DECREASED FROM 27 TO 8PERCENT (M. 22-5DEGREES), AND THE TEMP. OF TREATMENT WAS NEGATIVE 19 TO NEGATIVE 8DEGREES. WHEN THE UREA WAS RECRYSTD., THE YIELD OF FUEL WAS 68PERCENT, THAT OF PARAFFINS WAS 27PERCENT (M. 23DEGREES), AND THE TEMP. OF TREATMENT WAS NEGATIVE 19DEGREES. A METHOD OF DETG. THE ACTIVITY OF THE UREA FOR COMPLEX FORMATION WAS DEVELOPED, BASED ON MEASUREMENT OF THE HEAT OF COMPLEX FORMATION DURING DEPARAFFINATION UNDER STD. CONDITIONS. THE HEAT OF FORMATION INCREASED WITH INCREASED ACTIVITY OF THE UREA.

"Coefficients of Critical Axial Compressive Forces of Variable Intensity  
for Approximate Calculation of the Stability of Struts"

V sb. Raschety na prochnost'. Vyp. 15 (Strength Calculations--collection  
of works, No 15), Moscow, "Mashinostroyeniye", 1971, pp 278-290 (from  
PZh-Mekhanika, No 7, Jul 71, Abstract No 7V283)

Translation: The paper presents the results of a study of the stability  
of homogeneous struts of constant cross section compressed by axial forces  
of variable intensity with respect to a well developed classification of  
cases of end support and loading laws. The bent axis of the strut is ap-  
proximated by the elastic line of a beam in the case of some variants of  
transverse loading. The optimum variant, the form of the approximating  
function which ensures maximum accuracy, is selected according to the  
minimum coefficient of the critical value. The numerical values of the  
coefficients of critical loading and the corresponding parameter are pre-  
sented in tables for cases covered by the given classification. A com-  
parison with the results of some exact solutions shows that the approxi-  
mate values of the coefficients have a small error. Author's abstract.
