REMARKS:

Attached are drafts of the TOD array design revised per our group discussion yesterday. A few points trouble me and should be discussed at our Monday meeting. They are:

a. Functions -- under II.A. there ~~is~~ *is necessary* need for an additional category to accommodate a self-serving processing function. For example, NPIC and NSA have collateral info data banks which are exploited in support of processing of their own primary information product. (Imagery and COMINT). Second question concerns possible need for a "multi-user" category in II. B. On latter point, I prefer to keep it out and force processor to identify specific consumer.

b. Targets -- Are Free World areas grouped properly or should both parts of Africa be joined into one category, for example? Under V.B., is the nuclear non-proliferation area of sufficient significance to isolate as a category? Also, note VI which is an effort to provide a "box" for things like "basic scientific research" which will not be against any specific target.

See you Monday PM.
