ALKALI-PEGMATITES OF THE AFRIKANDA MASSIF
(Shchelechnyye Pegmatity Massiva Afrikanda). Nov 60
[24]p. 6 refs. RTS 1339.

Order from LC or SLA m\$2.70, ph\$4.80 61-15005

Trans. of Vsesoyuznoye Mineralogicheskoye
Obshchestvo. Zapiski (USSR) 1959, v. 88, no. 3,
p. 261-274.

A close spatial and genetic link was established between the alkali pegmatites of the Afrikanda, especially their early types, and the rocks of the first two intrusive stages. All these formations belong to a single genetic group, the ultrabasic alkali rocks. In the process of crystallization of the main rocks of the intrusion (pyroxenites) loss of the strong bases, accompanied by acute undersaturation of the magma with respect to SiO_2 , caused a considerable part of the Fe, Ti, Na, K, Ca and Al to pass over from the main to the residual phase of crystallization. The alkali

Bagdasar'yan, Kh.
PHOTOPOLYMERIZATION OF VINYL ACETATE.
[1961] 7p. 13 refs.
Order from OTS or SLA \$1.10 61-18171

Trans. of Acad Physicochimica U. R. S. S., 1944,
v. 19, p. 266-285.

DESCRIPTORS: *Acetates, *Vinyl radicals, Photo-
chemistry, Polymerization.

The photopolymerization of vinyl acetate in mixtures
with ethyl acetate and benzene has been investigated.
The rate of photopolymerization of pure vinyl acetate
and in mixture with ethyl acetate is proportional to the
square root of the intensity of incident light. A peculiar
relation is established between the ratio $V/\sqrt{I_0}$ and the
concentration of vinyl acetate. The temperature de-
pendence of the rate of polymerization corresponds to
an activation energy of 6.3 kg cal. The length of the
molecular chain is shown to be proportional to the
