Contract NASw-2036)

(NASA-TT-F-13207) Avail: NTIS CSCL08G

Elastic wave velocities were determined in rocks from the
Pechenga region of the Kola Peninsula, in cooperation with deep
seismic sounding studies of the area. The geological structure of
the region is discussed, as are the petrographic features of the
rocks in the Pechenga series. The data produced in laboratory
studies of velocity are used, together with field seismic data, as the
basis for a suggested structure for the region, a part of a deep,
linear depression deposited on the Archean basement in the
Proterozoic era.

(Contract NASw-2036)

(NASA-TT-F-13208) Avail. NTIS CSCL08G

Three groups of rocks from the three characteristic suites
of the region were tested under laboratory conditions at up to
12,000 kg/sq cm. Petrographic characteristics and photomicrographs
of cross sections of the specimens are presented. Observed
reflecting boundaries of the area are correlated to P-wave velocities
of rocks taken from the area as functions of pressures and related
deposition depths. Author
