The reaction of hydroxylamine-O-sulfonic acid with
triphenylphosphin yields triphenylphosphinimine,

drogen sulfate, methyl sulfate and picrate. If the reac-
tion takes place in the presence of thioethers in lieu of
phosphin, it will yield the heretofore unknown sul-
fiminies, $R_2S=NH$. These sulfiminies are less stable,

The oxides and salts used as adsorbents are shown to
exert a strong catalytic effect on the reaction

The intermediate endoperoxide state which is generally
postulated in the case of oxidation in solution probably
does not occur in reactions which take place at the
surface of powders, as shown by analogous measure-
ments with 9, 10-diphenylanthracene. With aluminum
oxide and silica gel as adsorbents, 1,4-dihydroxy-
anthraquinone (Quinizarine) is formed from anthracene
or anthraquinone in continuation of the above reaction.
In this case the catalytic influence of the adsorbents

The preparation of the compounds $C_5Cl_4O_2$ named in
the title, which have long been known but incorrectly
identified, was improved and their structure defini-
tively proved by new reactions as well as by UV and
IR. Perchlorocyclopentene-1-dione-3, 5 rearranged

on alkaline degradation of both compounds, 5H-tetra-
