USE OF HIGH FREQUENCY FILTRATIONS TO
SUPPRESS MANY-FOLD REFLECTED WAVES.

The use of high frequency filtrations permits a significant reduction of intensity of some multiple waves types. The suppression of the most intensive twofold reflected waves and of some partly multiple reflected waves was accomplished through the use of high frequency filtration ($f_{red} = 105 c; S_e = 6.0$). The choice of filtrations, available in a typical seismic station, is insufficient for the suppression of multiple waves. The introduction of additional filtrations in the average station or the use of a special high frequency apparatus is required. (Author)
