p. 41-45.

A radiation superheater placed along the whole height
of the furnace and made of low alloy steel type
12KhMF can work in complete safety in boilers at
 $p = 100$ atm, when maintaining the "weight velocity" of
the steam in the tubes at 700 to 1000 kg/m²-sec, and
with a steam temperature beyond the radiation super-
heater of 400°C. Calculations show that under the
same conditions a wall-type radiation superheater can
work at $p = 140$ atm as well. The "weight velocity" of
the steam weight in the tubes during the initial period

Ismelin guanethidine is a highly effective hypotensive
agent, producing a good therapeutic effect in essential
and renal hypertension. An improvement sets in
even in cases where other agents have proved inef-
fective. Treatment should be started with small doses
(10-20 mg per day), and in the absence of positive re-
