EXPERIMENTAL DETERMINATION OF THE SURFACE-AREA OF MAGNESIUM OXIDE FORMED IN THE THERMAL DECOMPOSITION OF THE CARBONATE, BY CHEMADSORPTION OF RADIOACTIVE CARBON DIOXIDE, $C^{14}O_2$. [1960] 8p. 6 refs.
Order from LC or SLA ml\$1.80, ph\$1.80 60-16768

Trans. of unidentified Russian article, 1956 or later.

Adsorption of radioactive $C^{14}O_2$ on the surface of samples of magnesium carbonate, all decomposed to the same extent at room temperature, does not depend on the duration of adsorption. Its magnitude at 218° and for different adsorption times is practically equal to that at room temperature. The adsorption of $C^{14}O_2$ and hence the magnitude of the surface area vary linearly with the percent decomposition of the initial magnesium carbonate. Because $C^{14}O_2$ adsorption is independent of temperature, it was assumed that the surface of magnesium oxide is completely covered by (Chemistry--Physical, TT, v. 5, no. 8) (over)
