DESCRIPTORS: \*Meat, \*Chromatographic analysis,  
Amino acids, Ammonia, Decomposition.

A quantitative analysis of the decomposition of meat  
proteins is made to determine the freshness of meat  
after prolonged storage. The individual amino acids  
are studied via partition paper chromatography. The  
procedure is described in detail. Other analytical  
methods used include bacterioscopy; pH determination;  
reaction with CuSO4 peroxidase, and formal; and visual  
fluorescence. The free amino acids as seen in the  
chromatogram are listed. The presence of threonine  
and methionine are noted.

Leading physical geographers take stock of the state of
